Sw. *geografi* = F. *géographie* = Sp. *geografía* = Pg. *geografia* = It. *geografia* = L. *geographia*, *< Gr. γεωγραφία, geography; < γεωγραφος, a geographer, lit. 'earth-describing,' < γη, the earth, + γραφω, write.*] 1. The science of the description of the earth's surface in its present condition, and of the distribution upon it of its various products and animals, especially of mankind, etc. See phrases below. The object of the geographer is to describe the earth's surface as it now exists. The geologist, on the other hand, seeks to throw light on the past history of the globe, although in doing this he must constantly refer to and study its present condition. — Abbreviated *geog.*

Strabo, in his work of *geographie* — that is to say, of the description of the earth — wrote, etc. — *Edall*, tr. of Apollonius of Perseus, p. 317.

The study of *geographia* is both profitable and delightful; but the writers thereof, though some of them exact enough in setting down longitudes and latitudes, yet in those other relations of manners, religion, government, and such like, accounted geographical, have for the most part misst their proportions. — *Milton*, Hist. Moscovia, Pref.

2. A book containing a description of the earth or of a portion of it; particularly, a school-book for teaching the science of geography. — **Botanical geography**. Same as *geographical botany* (which see under *botany*). — **Descriptive geography**, that part of the science of geography which involves only a statement of facts. Analyzing, comparing, and reasoning upon these facts is the domain of physical geography, or *physiogeography*. — **Medical geography**, the description of the surface of the globe as regards the influence of situation on the health, vital functions, and diseases of its inhabitants. — **Political geography**. Same as *physiogeography*. — **Physical geography**. Same as *physiogeography*. — **Political and historical geography**, the study of the division of the earth's surface among different tribes, peoples, and governments. Simple *political geography* is the study of the present condition of things in that respect; *historical geography* investigates and records the changes in the governmental control of territory which have occurred from time to time. This branch of the science is, in fact, history from a geographical point of view, or that kind of history which, to be made intelligible, requires the aid of maps. — **Sacred or Biblical geography**, the geography of Palestine and other Oriental countries mentioned in the Bible, having for its object the elucidation of Scripture.

Almost every branch of physical and natural science, or may be, called upon to throw light on the problems which present themselves to the geologist. Closely connected with geology, and indeed almost inseparable from it, is paleontology, or the study of ancient forms of life, since the rocks are found on examination to contain in many places remains of plants or animals, sometimes closely resembling, and often very different from, any now living on the earth. It is almost exclusively the order of succession of forms of life thus found which gives the geologist the means of making out a chronological arrangement for the different stratified formations. Physical geography, or physiography, is the necessary introduction to geology, and forms the link which unites the work of the geographer to that of the geologist. See *physical*. — **Structural geology**. See *structural*. — **Syn. Geology**, *Geomasy*. With the advance of the thirteenth century, the severity and geometric simplicity of line in tracery and ornament became less marked, and the style passed gradually into the Decorated. Geometridæ (jē-ō-met'ri-dē), *n. pl.* [NL., *< Geometra + -idæ*.] A large family of heterocerous lepidopterous insects or moths, named from the genus *Geometra*, whose larvae are measuring-worms; the geometers, geometrids, phalaenids, or *Phalaenidae*. This group, regarded as a family, is divided into 26 subfamilies, named *Urepterinae*, *Ennominae*, *Gnophominae*, *Amphidestinae*, *Coarctinae*, *Boletobinae*, *Geometrinae*, *Microcerinae*, *Paludinae*, *Ephyrinae*, *Acidalinae*, *Mecocorinae*, *Cabrerae*, *Mesurinae*, *Fidolinae*, *Hazinae*, *Zerinae*, *Luginae*, *Uperinae*, *Larentinae*, *Enobrinae*, *Sioninae*, *Redyinae*, *Erastinae*, *Empicorinae*, and *Hyposocrinae*. In some systems, as Guenée's, these are all elevated to the rank of families, ending in *-idae*, and the superfamily thus constituted, called *Phalaenidae*, is the *Geometrina* of English authors. The names *Geometridæ* and *Phalaenidae* are exactly synonymous; and the various names resulting from the changes in termination of the two words are applied to what is practically an identical group of moths, rated higher or lower in the taxonomic scale, according to the classificatory views of different authors. See the extract, and *cuts* under *Cidarid* and *Haploides*.

The *Geometridæ* or *Phalaenidae* form a family of great size, being exceeded in numbers among the Lepidoptera only by the noctuids and tineids, and probably equalled only by the pyralids and tortricids. They are . . . widely distributed over the globe, and the caterpillars of many species have proved very destructive to some of our most important vegetable productions. The moths have rather long, slender bodies, the thorax without tufts or crests. Ocelli are present in some species, and absent in others. The antennae are either simple, ciliated, or pectinated. The fore wings are large and triangular; the outer margin . . . is nearly as long as the hinder margin. The hind wings are ample. . . . In some [species], the females are wingless, or have only rudimentary wings, which are useless for flight. . . . The caterpillars are slender and naked, usually with two pairs of abdominal legs, though rarely they have three or four pairs. This deficiency causes them to move along with a looping gait, and hence they are often called "measuring-worms," from which fact the family name [*Geometridæ*] was given.

2. A text-book of geometry. Abstract geometry, the general theory of the connections of more than two variables. Geometry, in its analytical treatment, appears as identical with the algebra of two or three variables. A similar study of the connections of a number of variables in general is called *multidimensional geometry*, and abstract geometry as not descending to particulars.

— **Algebraic, algorithmic, analytical, Cartesian, coordinate, etc., geometry.** See the adjectives. **Common or elementary geometry**, that treatment of geometry which assumes no previous knowledge of the subject, and is supposed to be well known in all other mathematical writings. This discipline remains in nearly the condition in which Euclid left it. See *Euclidean geometry*.

— **Descriptive geometry** (invented by Gaspard Monge, 1794), the theory of making projections of any accurately defined figure such that from them can be deduced, not only its projective, but also its metrical properties. It is highly useful in engineering. The name is also applied to the theory of geometry in general treated by means of projections. **Elliptic geometry**, a system which assumes that space returns into itself, so that there are no points whose distance exceeds a certain finite distance. — **Enumerative or denumerative geometry**, the theory of the number of solutions of geometrical problems, and of the number of incidences and coincidences in a diagram drawn under given conditions. — **Euclidean geometry**, a system of geometry which adopts the assumptions of Euclid with regard to space, namely, that space is an infinite continuum of three dimensions, that rigid bodies are capable of translation and rotation in all directions in every position, and that the sum of the three angles of a plane triangle is equal to two right angles. — **Geometry of forces**, the theory of congruences and complexes of forces. **Geometry of position.** (a) A branch of geometry created by the French revolutionary statesman Carnot, which traces the connection between the changes of an equation and the changes of position of a locus. (b) Modern projective geometry, commonly written in German *Geometrie der Lage*, to distinguish it from (a).

— **Geometry of space, geometry of three dimensions**, geometry of figures not restricted to a plane or other surface. — **Geometry of the compasses**, a system of geometry in which the postulate that a right line be describable is not admitted, but instead links turn about pivots and are connected together. The first important discovery in this branch of geometry was the Peaucellier cell. See *cell*. — **Graphical geometry.** Same as *projective geometry*. — **Higher geometry**, any geometry not elementary; especially, modern synthetic geometry. — **Hyperbolic geometry**, a system which assumes that space though infinite in measurement, has a real and definite boundary, separating the points at a real distance from points at an imaginary distance. — **Linear or line geometry**, the theory of systems of rays, congruences, and complexes. — **Metric or quantitative geometry** treats of the distances of points or the magnitude of angles, arcs, surfaces, volumes, etc. — **Modern geometry**, the synthetic geometry which has been developed in the nineteenth century by Carnot ("*Geométrie de position*," 1803), Brianchon ("*Mémoire sur les lignes du second ordre*," 1817), Poncelet ("*Traité des propriétés projectives des figures*," 1822), Möbius ("*Barycentrische Calcul*," 1827), Steiner ("*Systematische Entwicklung*," 1828), Chasles ("*Geométrie supérieure*," 1832), Von Staudt ("*Geometrie der Lage*," 1847), and others. — **Organic geometry.** (a) A kind of geometry invented by Maclaurin (1719), in which more complicated curves are produced from less complicated ones. Hence (b) Higher synthetic geometry in general. — **Parabolic geometry**, a system which assumes (in harmony with Euclidean principles) that the locus at an infinite distance consists of two coincident planes with an imaginary circle upon them. — **Plane geometry**, the geometry of figures all lying in one plane. — **Practical geometry.** (a) Surveying. (b) The art of geometrical drawing. — **Projective geometry**, a method of investigating geometry by the application of the theory of projections. — **Segmentary geometry**, modern synthetic geometry, especially when treated by means of the anharmonic ratio. — **Solid geometry.** (a) The elementary geometry of solid bodies. (b) Geometry of three dimensions. — **Speculative geometry**, the science of geometry proper, as distinguished from *practical geometry*. — **Spherical geometry**, the geometry of figures drawn on the surface of a sphere. — **Synthetic geometry**, geometry treated not by means of coordinates or other algebraic devices, but by means chiefly of projections. — **Theoretical geometry.** Same as *speculative geometry*. — **To hang by geometry**, to have the clothes hang loosely, out of shape, or in rags.

The order as now understood is very polymorphous, comprising a half dozen or more tribes which have been ranked as distinct orders by some authorities. It includes 202 genera and 750 species, distributed through the temperate and subtropical regions of the globe, but especially abundant in South Africa. There are about 100 species, inhabiting temperate regions, of which 15 or more are North American. They have blue or rose-colored flowers, and a few of the species are rarely cultivated in gardens. Most of the species are astringent, and the roots of several have been used in medicine, as of the *G. maculatum*, a common plant in the United States. From the long beak of the fruit, the common species have received the name of *crane's-bill*. The herb Robert, *G. Robertianum*, with dissected leaves, is native of both Europe and the United States.

Germ theory. (a) In *biol.*, the doctrine of biogenesis; the theory that living matter cannot be produced by evolution or development from non living matter, but is necessarily produced from germs or seeds. The doctrine is opposed to that of abiogenesis, or spontaneous generation. See *biogenesis*. (b) In *pathol.*, the doctrine that zymotic diseases, together with some not usually classed as zymotic, are due to the presence in the body of living organisms. These organisms, which, so far as they have been positively identified, belong for the most part to the group of bacteria, produce their morbid effects by their

vital activity, and probably in large part by the formation of poisons called *ptomaines*. This doctrine no longer rests upon indirect evidence alone, but also on the positive identification of the peccant organisms in a certain number of diseases, as in phthisis, anthrax, relapsing fever, typhoid fever, and some others. — *Syn.* *Fetus*, *Rudiment*. See *embryo*.

German² (jér'man), *a.* and *n.* [*< L. Germanus*, *a.* and *n.*, *German*, *Germani*, *n. pl.*, the Germans, *Germania*, Germany. The name is prob. of Celtic origin, and is said to mean 'shouters,' or, according to another explanation, 'neighbors.' The G. word for 'German' is *Deutsch*; 'a German,' *ein Deutscher*; see *Dutch*.] **I. a.** Of or pertaining to an important Teutonic race inhabiting central Europe, or to Germany, or to its inhabitants or their language. At the beginning of the Christian era the Germans occupied central Europe eastward to the Vistula, southward to the Carpathians and Danube, and westward to beyond the Rhine. Among their chief tribes were the Suevi, Lombards, Vandals, Heruli, Chatti, Quadi, Chali, and Cherusi. After the epoch of migrations in the third and fourth centuries, many tribes, as the Franks, Burgundians, Lombards, and Vandals, settled permanently in other regions, and became merged in the new French, Italian, and Spanish nations. In the East the Germans were displaced by Slavs, although important parts of this region have since been Germanized. Since about the twelfth century the Germans have called themselves *die Deutschen*. In medieval and modern times they have occupied a region which has had many political changes, but which has remained of substantially the same extent for centuries. The former Roman-German empire contained various lands not inhabited by Germans. At the present time the Germans form the great majority in the reconstituted German empire; they number over one fourth of the inhabitants of Austria-Hungary, chiefly in the western and northwestern parts; there are about 1,000,000 Germans in the Baltic provinces and elsewhere in Russia, and over two thirds of the Swiss are of German race and language. Its progress was hindered by governmental interference and by internal disputes between the two chief leaders, Ronge and Czerski. After the reaction from the revolution of 1848 nearly all its members were gradually absorbed in other religious bodies.—**German duck.** See *duck*².—**German empire.** See *Holy Roman Empire*, under *empire*.—**German flute.** See *flute*¹, 1 (c).—**German fringe, gold, hone, millet**, etc. See the nouns.—**German paste**, a kind of paste composed of pea-meal, sweet almonds, lard, sugar, bay-saffron, and hard-boiled egg, used for feeding larks, thrushes, nightingales, and other singing birds.—**German plate-glass.** Same as *broad glass* (which see, under *broad*).—**German porcelain and pottery**, porcelain and pottery produced in Germany. The best-known varieties of German porcelain are those of Meissen (generally called Dresden) and Berlin. Other celebrated factories are those of Anspach, Roest, Frankenthal, Ludwigsburg, Nymphenburg, and Grossebrunnbach.—**German sarsaparilla, silver**, etc. See the nouns.—**German sixth**, in *music*, a chord of the extreme sixth, containing the major third and perfect fifth of the bass, as shown in the figure. **German snipe**, the dowitcher; so called in distinction from English snipe. II. n. 1. A member of the German race, or a native or an inhabitant of Germany. See *I.*—**2.** The language of Germany or of the German people, a sub-branch or division of the Teutonic or Germanic branch of Indo-European or Aryan language. Its two principal divisions are the Low German, of the northern or lower part of the country, and the High German, of the southern or higher part. See *High German*, *Low German*, below.

3. Especially, the literary language of Germany. It is one of the High-German dialects, the former court and official dialect of Saxony (though not entirely free from elements of other dialects), and was brought into general learned and literary use, early in the sixteenth century, by Luther's writings, especially by his translation of the Bible. **High German**, a collective name for the dialects of central and southern Germany, as distinguished from the Low German of the north. The dialects it includes are many and of various groups, as *Alemannic*, *Frankish*, *Austrian*, etc. Its history is divided by the existing literary documents into three periods: Old High German, from the eighth to the twelfth century (the leading dialect, *Frankish*, the literature chiefly *Christianizing*); Middle High German, from the twelfth to the sixteenth century (one of the leading dialects, *Swabian*, the literature chiefly *epic*, as the *Nibelungenlied* and *Helden-sagen*, and lyric, as the writings of the Minnesingers); and the New High German, or the Modern German, or German from the sixteenth century down. See above.—**Low German**, a collective name for the dialects of northern Germany and the Low Countries, among which the *Netherlandish* or *Dutch* and the *Plattdeutsch* have literatures at the present time. In a restricted sense, the name is applied to the Low German as spoken in the northern parts of Germany. It is divided historically into three periods, Old Low German, Middle Low German, and Modern Low German, corresponding substantially to the periods of High German. The dialects of the Teutonic invaders of Britain were of the Old Low German class. See *Anglo-Saxon*, *English*, *Frisic*, *Dutch*, etc.

membrane or blastoderm; also, the cell-wall of an ovum. — **Germinal pole**, the central point from which development spreads in the ovum of some animals, as a bird or mammal; the pole of a germ-area. *Quinn*. — **Germinal spot**, the nucleus of a germ-cell or ovum. Jer. Taylor, *Works* (ed. 1835), II. 12.

Specifically, in *bot.*: (a) The process of development of the embryo of a seed into a perfect plant. The conditions necessary for germination are the presence of moisture, free oxygen, as in atmospheric air, and warmth. Moisture softens the integuments of the seed and relaxes the tissues of the embryo, at the same time dissolving such nutrient matters in the seed as sugar, dextrine, etc., in readiness for their assimilation by the embryo. The absorption of oxygen is necessary for the chemical changes which always accompany growth. The degree of warmth needed to excite to action the vital forces of the plant varies in different species; some seeds, as those of wheat, being capable of germinating upon melting ice, while others require a temperature of over 60° F. During germination various chemical changes take place in the starch and other insoluble material stored up for the use of the embryo in the cotyledons or in the albumen of the seed, rendering them soluble and fit for assimilation; which changes are usually accompanied by an increase of temperature, as is seen in the process of malting. As an immediate result of the growing process thus excited and carried on in the seed a root is produced which strikes downward, fixing itself in the soil and beginning to absorb thence nourishment for the new plant. At the same time the other extremity of the axis of growth is directed upward and develops a stem and leaves. (b) The similar development of a plant from the spore in cryptogams. (c) The early period of growth in a bud as of a bulb or of a rhizome. (d) The protrusion and growth of the pollen tube from the pollen grain.

germ-layer (jér'm'la'ér), *n.* In *biol.*, any blastodermic membrane or blastoderm; any layer of cells, forming a membrane, which enters into the structure of a germ in its early stages. The first is the single blastoderm of a blastula or vesicular morula. By invagination this germ-form becomes a gastrula, with two germ-layers, the hypoblastic blastodermic layer, or endoderm, and the epiblastic blastodermic layer, or ectoderm; development between which two of a third mesoblastic layer of cells, or mesoderm, and subsequent splitting of this into an inner and an outer layer, called splanchnopleure and sonatopleure, results in the four-germ-layers of most metazoic animals. Names of special germ-layers or germ-membranes are: *blastophylla*, *epiblast*, *mesoblast*, *hypoblast*, *endoderm*, *ectoderm*, *mesoderm*, *sonatopleure*, *splanchnopleure*, etc. They are also called *layers*, as skin-layer, serous layer, etc. See cuts under *gastrula* and *gastrulation*.

The Metazoa can alone be considered as true animals, and the origin from two primary *germ-layers* may be held to form the primary character of the animal kingdom.

germ-plasma (jér'm'plaz mij), *n.* Protoplasm peculiar to a germ or ovum, and supposed to influence or determine the character of the resulting organism, by virtue of its special chemical or molecular composition. Germ-plasma may thus be considered, theoretically, as the physical basis of all the phenomena which are grouped under the name of heredity.

The *germ-plasma* is regarded as a substance of peculiar chemical or even more special molecular composition, which passes over from one generation to another.

Jour. Roy. Micros. Soc., 1886, p. 213.

germ-pore (jér'm'pôr), *n.* In *cryptogamic bot.*, a pore or pit in the outer integument of a spore, through which the exit of the germ-tube takes place.

Many of these pores serve as places of exit for the tubular outgrowths from the spore at the time of germination, and may therefore be termed *germ-pores*; others perform no such function, and are therefore only simple pores or pits.

The majestic tree of human thought can never be comprehended unless regard is had to the formless *germule* of the psychical life of the zoophyte, and ascending evolution is followed up in the animal series.

Fr. or Allen, *and Neurol.*, VI. 495.

germ-vesicle (jér'm'ves'i-kl), *n.* In *embryol.*, a germ in a vesicular state. It is either (a) a true germ-vesicle or blastula, preceding gastrulation, as in most animals, or (b) an intestinal germ vesicle or gastrocystis, peculiar to mammals; in the latter case it follows gastrulation, and is generally conformed with a blastula; it is what is called in human anatomy the blastodermic vesicle. The redistricting was intended (it was believed at the instigation of Gerry) to secure unfairly the election of a majority of Democratic senators. It is now known, however, that he was opposed to the measure.] In U. S. politics, an arbitrary arrangement of the political divisions of a State, in disregard of the natural or proper boundaries as indicated by geography or position, made so as to give one party an unfair advantage in elections. The effect of such a proceeding has sometimes been to secure to a party a majority in the legislature of a State, or in its quota of members of Congress, at an election in which the opposite party received a majority of the total number of votes.

nearly 100 feet. The height of the column is probably
diminishing, as some old estimates make it much greater.
There are numerous geysers in the Yellowstone region of
the United States, some of which throw water to an eleva-
tion of 200 feet or more, and also on the North Island of
New Zealand; and in the Napa valley of California are
boiling springs that have been improperly called geysers.
(See *boiling spring*, under *boiling*.) The true theory of the
action of the Great Geyser of Iceland, and hence of geys-
ers in general, was first established by Hansen. The ejection
of the water is caused by explosive action, due to the
heating of the water, under pressure, in the lower part of

The heated water acquires after a time elastic force suffi-
cient to overcome the weight of the superincumbent wa-

so great that steam is generated rapidly, and to such an
amount as to eject violently from the tube a great quantity
of the water.

Ghee is largely used medicinally as an emollient and stomachic, and as a dressing for wounds and ulcers. For these purposes it is esteemed in proportion to its age. When carefully prepared from pure materials it will keep sweet for a great length of time, and it is not extraordinary to hear of ghee a hundred years old.

=Syn. *Ghost*, *Shade*, *Apparition*, *Specter*, *Phantom*, *Phantasm*. *Ghost* is the old word for the disembodied spirit, especially as appearing to man; as, the *ghost* of Hamlet's father; the *ghost* of Banquo. *Shade* is a soft and poetic word for *ghost*; as, the *shade* of Cæcilia appeared to Æneas. A *specter* is an alarming or horrifying preternatural personal appearance, having less individuality, perhaps, than a *ghost* or *shade*, but more than an *apparition* necessarily has. A *phantom* has an apparent, not a real, existence; it differs from a *phantasm* in emphasizing the unreality simply and in representing a single object, while *phantasm* emphasizes the deception put upon the mind, and may include more than one object.

The first includes all the common methods of gilding by laying gold-leaf or gold-powder upon an adhesive surface, as in sign-painting, house-decorating, etc. The soldering of gold to a cheaper metal and rolling both down to a thin sheet is properly gold-plating. The chemical processes in gilding include electroplating with gold, by applying gold in an amalgam and afterward driving off the mercury by heat, applying gold to metals by dipping them in a bath of some solution of gold, and enameling with gold on porcelain or glass, the gold being put on the ware as a paint and afterward vitrified in a furnace.

ML. *gilla*, a wine-vessel, *gella*, a wine-vessel, a wine-measure, etc.; perhaps from the same ult. source as *gallon*, q. v.] 1. A liquid measure, one fourth of a pint in the British and United States systems. The United States gill contains 7.217 cubic inches, equal to 118.36 cubic centimeters. The British imperial gill contains just 5 ounces avoirdupois of distilled water at 62° F., weighed in air under a pressure equal to that of 30 inches of mercury at London, being equal to 142 cubic centimeters or 1.2 United States gills. Until about 1825 the gill was not considered as part of the regular system of English measures of capacity, and there was some want of uniformity in the use of the name. (See the extract from *Carew*.) In the north of England and parts of Scotland a half pint was called a gill. The Scotch gill was $\frac{3}{4}$ of a Scotch pint, and was therefore about equal to the English gill.

Gill of Fish.

A, first branchial arch of left side of black-bass; 1, gill-rakers; 2, branchial lamellæ. C, same, in cross-section; 7, branchial lamellæ; 8, a gill-raker. B, same arch of striped-bass, with appendages removed; 3, 4, 5, and 6, pharyngobranchial, epibranchial, ceratobranchial, and hypobranchial segments.

consist generally of rows of compressed filaments arising from the outer sides of the gill-arches, between which are the gill-slits through which water is poured in respiration to bathe the gills, the set of gills being usually contained in cavities shut in by the gill-covers and communicating with the mouth. There are usually four rows of gills in true fishes, but there may be fewer; in selachians there are generally five pairs; the details of the arrangement are very various. In *Amphibia* the gills are similar to those of fishes in their situation and general character, but they usually present externally as tufted organs on each side of the neck, and in many cases are rudimentary, being replaced by lungs. In *Mollusca* the character of the gills is very different, and their disposition is so variable that they are made a means of establishing many of the orders and subordinate groups of that division of the animal kingdom. In an oyster, for example the gills are the folds or plaits which lie in layers around a considerable part of the circumference of the animal. (See cuts under *Dendroaetus*, *Doris*, *Lamellibranchiata*, and *Polyplocophora*.) In *Crustacea* the gills are commonly appendages of some of the legs, very variable in number and situation, as pedobranchia, pleurobranchia, etc. (See *epipodite*, and cut under *Podophthalma*.) Among *Fuscula* gills are filamentous or foliaceous external appendages of the trachea of aquatic insects which breathe in the water. In *Arachnida* the gills are the external parts of the breathing-organ, each gill consisting of a minute slit covered with a scale; there are two or four of these on the lower side of the abdomen, near the base. In *Fernae* gills are the respiratory organs, of whatever character, commonly fringing the sides of the body or forming tufts on the head.

girder-bridge (gêr'dêr-brīj), *n.* A bridge in which the support is afforded by girders or beams. At the period of development of railway construction many bridges were built with cast-iron girders; the limit of safe span of such was generally accepted as 40 feet. This limitation, and the treacherous nature of the material, led to the substitution of wrought-iron formed into plates, which were placed vertically and strengthened and stiffened by angle-irons. The latter form of construction culminated in the box girder bridge or tubular bridge. Bridges with framed girders are more generally called *truss-bridges* or *arched girder-bridges*. See *arched-beam bridge*, under *bridge*, 1.

A band, belt, or zone; something drawn round the waist of a person and fastened; as, a *girdle* of fine linen; a leather *girdle*. The primary use of the girdle is to confine to the person the long flowing garments anciently and still in some countries, worn by both men and women; and it is now frequently used in women's dress commonly called a *belt* and in military costume (a *belt* or *sash*). (See *esch*.) The girdle has also served for the support of weapons, utensils, bags or pockets, etc. In the middle ages books were sometimes bound with a strip of flexible stuff hanging from one end of the volume, which could be drawn through the girdle and secured. Among many peoples, the girdle being large and loose, the scabbard of a sword or long dagger is passed through the girdle instead of being hung from it, a hook or projecting button serving to hold it in place. In ecclesiastical use the girdle is a cord with which the priest or other cleric binds the altar about the waist. Formerly it was flat and broad, and sometimes adorned with jewels; in the Roman Catholic Church it has been changed to a long cord with dependent extremities and tassels. It is regarded as a symbol of continence and self-restraint. It is usually of linen, though sometimes of wool, and is generally white, but sometimes colored to adapt it to the color of the other vestments.

It is a white, brittle, deliquescent solid.—**The glacial epoch**, a period of the earth's history when, as maintained by many geologists, an ice-sheet extended from the Scandinavian range in all directions, encroaching on Finland, northern Germany, and even a part of Great Britain; the glaciers of the Alps, Caucasus, and Pyrenees being also at that time considerably larger than they are now. Traces of former glaciation are observed in abundance over wide areas in northeastern North America, and are ascribed by most geologists to the former presence of an ice-sheet covering that region. The difficulty of accounting for the presence and movement of such a sheet on the American side of the Atlantic is much greater than is the case on the European side. Since in New England and the region of the great lakes much of the superficial detritus has been moved southward from the place of its origin for a greater or less distance, and since this fact was frequently observed and much commented on before ice became a recognized factor in geology, the phenomena now usually designated as *glacial* in Europe have been in America associated with the word *drift*, the loose material on the surface being called by that name, and the epoch of its accumulation, the *drift epoch*.

glacialist (glā-shi-āl-ist), *n.* [< *glacial* + -ist.]

1. One who explains geological phenomena by reference to the former presence of ice. The word is little used in this sense except with some other word qualifying it; as, an advanced *glacialist*; an *ultra-glacialist* (one who is prone to magnify the importance of ice as a geological agent).

By a cursory glance the *glacialist* is led to believe that the markings must be referred to the streams of inland ice.

Nature, XXX. 263.

We have certainly no evidence that, during even the severest part of the glacial epoch, an ice-cap, like that advocated by Agassiz and other extreme *glacialists*, ever existed at the North Pole.

J. Croll, *Climate and Cosmology*, p. 78.

2. One who makes a specialty of glacial geology.

Not is it only the effects of land ice which the *glacialist* sees marked upon the rocks of Britain.

Huxley, *Physiography*, p. 165.

Also *glaciologist*.

glacially (glā-shi-āl-ē), *adv.* By means of glaciers or of glacial action; as, *glacially* formed hollows.

glaciarium (glā-shi-ā-ri-um), *n.*; pl. *glaciaria* (-æ). [NL., < L. *glacius*, ice, Cf. *glacier*.] A place, as a building, provided with a smooth level flooring of artificial ice or of cement, for skating, especially in summer; a skating-rink.

Summer skating has been occasionally provided in "*glaciaria*" by means of artificially produced ice. *Encyc. Brit.*, XXII. 105.

glaciate (glā-shi-āt), *v. t.*; pret. and pp. *glaciated*, pp. *glaciating*. [< L. *glacialis*, pp. of *glaciare*, turn into ice, freeze, < *glacies*, ice.] 1. *trans.* 1. To convert into ice.

To measure by the differing weight and density of the same portion of water what change was produced in it betwixt the hottest time of summer, and first a *glaciating* degree of cold, and then the highest we could produce by art.

Boyle, *Works*, II. 522.

2. To cover with ice.

The formerly *glaciated* hemisphere has . . . become the warm one, and the warm hemisphere the *glaciated*.

Quoted in J. Croll's *Climate and Time*, p. 77.

3. To give an ice-like or frosted appearance to. [A trade use.]

[Iron] chimneys, ovens, etc., and melted, not enameled, *glaciated*, or tinned. U. S. Cons. Rep., No. 723 (1887), p. 215.

II. *intrans.* To be converted into ice. *Johnson*.

glaciated (glā-shi-ā-ted), *p. a.* Covered with ice; also, acted upon by ice; showing the effects of glacial action.

Rocky substances which have once been *glaciated*, if I may thus express the peculiar action of ice upon rocks, viz. the planing, polishing, scratching, grooving, and furrowing of their surfaces, can never be mistaken for any thing else.

C. F. Hall, *Polar Expedition*, p. 661.

On almost every *glaciated* surface in Maine may be found isolated drift scratches aberrant both in direction and outline.

Amer. Jour. Sci., 3d ser., XXX. 146.

glaciation (glā-shi-ā'shon), *n.* [< *glaciate* + -ion.] 1. The act of freezing.

The water or other liquor usually beginning to freeze at the top, and it being the nature of *glaciation* to distend the water and aqueous liquors it hardens, it is usually and naturally consequent, that when the upper-crust of ice is grown thick, and by reason of the expansion of the frozen liquor bears hard with its edges against the sides of the glass contiguous to it, the included liquor (that is by degrees successively turned into ice), requiring more room than before, and forcibly endeavoring to expand itself every way, finds it less difficult to burst the glass than lift up the ice.

Boyle, *List. Cold*, v.

2. The result of freezing; ice. [Rare.]

It [ice] is plain upon the surface of the water, but round in hayl, which is also a *glaciation*.

Sir T. Browne, *Vulg. Err.*, ii. 1.

3. In *geol.*, the present or former existence of a mass of ice, glacier, or ice-sheet, covering a certain region; subjection to the action of ice. Thus, it is said that the surface of the country in Sweden exhibits the effects of a former *glaciation*—that is, that the surfaces of the rocks in many places are smoothed or striated, as they are under or near actual glaciers in the Alps or elsewhere. Such surfaces are said to be *glaciated*.

4. A consequence of or phenomenon caused by such a process or covering, as the striation and smoothing of rock-surfaces.

glacier (glā-shi-ēr or glā-si-ēr), *n.* [< F. *glacier* (orig. Swiss. > G. *gletscher*), < *glace*, ice, < L. *glacies*, ice.] The form in which the snow, falling on the higher parts of those mountain-ranges which are above the snow-line, finds its way down into the valleys. Under suitable climatic conditions, the snow which thus falls does not all disappear by evaporation, or melt at once and run off in the form of water, but becomes gradually converted into ice, and moves slowly down the mountain-slope in the depressions or valleys until it reaches a point where the mean temperature has so far risen that evaporation and melting counterbalance the supply from above. Here the glacier ends, and a stream of water begins, which is often the head of some large river, as the Gangotri glacier of the Ganges, or the Rhone glacier of the river of that name. The snow of the glacier is not transformed into ice at once, but passes through the intermediate stage of neve (German *fron*). (See *fron*.) Several subordinate glaciers often combine to form one large one, a result dependent on the topography of that part of the mountain-range in which the glacier takes its rise. The great glaciers, those of the first order, as the Gornier and the Aletsch glaciers in Switzerland, begin in large amphitheaters (*cirques*), where a considerable number of affluents are forced by the topographical conditions to unite in forming one great glacier. The ice-stream of the longest glacier in the Swiss Alps, the Gross Aletsch, was in 1880 104 miles in length; some in the Himalayas are four times as long. From the cliffs which overhang the glacier is always being detached, by frost and aerial erosion, more or less detritus, which is carried downward on the ice as it moves, and finally dumped at the terminus of the ice-mass. Such accumulations of debris are called *moraines*, and are very conspicuous on many glaciers. (See *moraine*.) The former greater extension of glaciers over certain regions has been, and still is, a subject of much discussion among geologists. See the *glacial epoch* (under *glacial*) and *ice*.—**Glacier tables**, large stones found on glaciers supported by pedestals of ice. The stones attain this peculiar position by the melting away of the ice around them, and the depression of its general surface by the action of the sun and rain. The block, like an umbrella, protects the ice below it from both; and accordingly its elevation measures the level of the glacier at a former period. After a time the stone table becomes too heavy for the column of ice on which it rests, or its equilibrium becomes unstable, whereupon it topples over, and, falling on the surface of the glacier, defends a new space of ice, and begins to mount afresh. J. D. Forbes.

glacière (glas-i-är'), *n.* [F., < *glace*, ice; cf. *glacier*.] A cave, fissure, or depression of some kind in which ice remains permanently, although in quantity varying with the year and the season: sometimes called, in New England, an *ice-cave* or *ice-glen*.

Certain exceptional cases occur where, owing to the subsidence of the cold winter air into caverns (*glaciers*), ice is formed which is not wholly melted, even though the summer temperature of the caves may be above freezing point.

glacieret (glä'shiër-et or glas'i-ër-et), *n.* [< *glacier* + *-et*.] A small sheet of ice or névé, lying under the snow-fields at the summits of the highest points in the Cordilleras, and exposed to view when after a series of exceptionally dry years the snow has nearly or quite melted away: a name given by J. Le Conte. The glacierets are considered by some to be properly denominated *glaciers*, and by others to be something quite different from true glaciers.

The latter [attenuated edges, border of the drift] are thought to represent, one a glacial and the other a *glacionatant* action.

glacioust (glä'shi-us), *a.* [< OF. *glacieur*, < L. *glacies*, ice.] Like ice; icy.

Which [mineral solutions] will crystallize . . . into white and glacioust bodies.

glacis (glä'sis, or as F., glä-së'), *n.* [= D. G. Dan., etc., *glacis*, < F. *glacis*, formerly also *glacsis*, a slippery place, a sloping bank or causeway, a strong pent-house upon the walls or the rampart of a fortress, < OF. *glacis*, icy, slippery, *glacier*, formerly also *glasser*, < L. *glaciare*, freeze, harden: see *glaciate*.] A gentle slope or sloping bank. (a) In fort., a sloping bank so raised as to bring the enemy advancing over it into the most direct line of fire from the fort; that mass of earth which serves as a parapet to the covered way having an easy slope or declivity toward the campaign or field.

Sw. *gladiator*, < L. *gladiator*, < *gladius*, a sword (there is no verb **gladiare*); see *glare*.] 1. In Rom. antiqu., one who fought in public for the entertainment of the people, either with other gladiators or with wild animals. Gladiators were at first prisoners, slaves, or condemned criminals; but afterward freemen fought in the arena, either for hire or from choice. Under the empire, knights, senators, and even women exhibited themselves on the occasion of public funerals, but afterward at entertainments of various kinds, and especially at public festivals given by the emperors and other magistrates. They usually fought in the amphitheatre, sometimes in the forum, sometimes at the funeral pyre. They were kept and trained in special establishments or schools, sometimes by persons who let them out for hire, sometimes by citizens who wished to exhibit them themselves. Gladiators were divided into different classes, according to the arms or mode of fighting. Thus, *securo* were such as carried a kind of trident and a net (*rete*), in which they endeavored to entangle their opponents, usually *scutarii* (*opuntarii*) who were lightly armed. *Thraeces* were those armed with the round shield or buckler of the Thracians and a short sword or dagger, the *armatores* had an oblong shield curved to suit the shape of the body, and fought with either the Thraeces or the *retiarii*. There were also those who fought blindfolded, their helmets being without eye-holes (*andabatores*), in troops (*catervarii*), in chariots (*essadarii*) on horseback (*equites*) etc. In case the vanquished was not killed in the combat the people were usually allowed to decide his fate. If they decreed his death, they extended their hands with the thumb bent and concealed (*recond*) by the clenched fingers, if they voted to spare him, they held out their hands with the thumb extended outward (*extol*). These precise gestures are still a subject of controversy, but the texts appear to support the version here given. Accord-

5. In *mining* and *mineral*, the English equivalent of the German *glanz*, a term used by German miners to designate various ores possessing that peculiar luster and color which indicate that they are metalliferous combinations. Such are *blühende galena*, a sulphuret of lead, *blühende chromate*, specular iron ore, a sesquioxide of iron, and many others. A sharp line cannot be drawn between *glanz* and *luster* as used by German miners. The equivalent of the latter in English is *parietal*; as, iron *parietal*, copper *parietal*, etc. This word is in common use among both scientific men and miners; but the word *glance* as the equivalent of *glanz* is less frequently heard, although by no means obsolete, since *copper glance*, *antimony glance*, and other similar names are met with occasionally.

gland (gländ), *n.* [*< F. glande*, *f.*, a gland (cf. *F. gland*, *m.*, = Pr. *glant*, *glan* = It. *ghianda*, an acorn), *< L. glans* (*gland*), an acorn (*> dim. glandula*, a gland; see *glandula*); cf. Gr. γλάνη, an acorn, prob. *< γλάνη*, throw, cast.] 1. In *anat.*: (a) A lymphatic ganglion; one of the numerous small, smooth, rounded organs which occur in the course of the lymphatics; formerly more fully called *conglobate gland*. See *cut* under *lymphatic*. (b) Some secretory part or organ; a secreting cyst, follicle, or the like, generally of mucous or tegumentary surfaces, or a conglomeration of such parts composing some organ which secretes or excretes a substance peculiar to itself as the liver, kidney, pancreas, parotid gland, testicle, etc., or the lacrymal, sebaceous, salivary, gastric, intestinal, and other glands. Glands, thus specifically defined, are either *simple*, consisting of a single secretory follicle or cyst or compound, consisting of an aggregate of such structures, the latter are also called *tubular*, *sacculate*, *alveolar*, etc., according to their intimate structure. The so-called *ductless* or *vascular glands* (see *cut*) are not in this category, it being the essential character of a gland in this sense that it have an outlet for its special secretion. Glands of both these kinds were formerly classed as *conglobate glands*, in distinction from *conglobate* or *lymphatic glands*. (c) Some smooth rounded part or organ of undetermined function, as the spleen and the thyroid and thymus. See *ductless gland*, below. (d) The glans penis or glans clitoridis, the head of the penis or of the clitoris.—2. In *bot.*: (a) An acorn; also, the similar involucre nut of the hazel, beech, and chestnut. (b) A secreting organ upon the surface of any part of a plant, or partially embedded in it. The term is extended to include also any protuberance or structure of a similar nature, though it may not secrete. Glands vary much in form and appearance, and in the character of their secretions.

3. In *mach.*, a contrivance, consisting of a cross-piece or clutch, for engaging or disengaging machinery moved by belts or bands.—4. In steam-engines and other machines: (a) A stuffing-box. (b) A joint so tightly packed as to retain oil or other lubricating fluid for a considerable length of time. Also called *gland-box*.

material or imperfection in the manufacture, only slightly translucent. Glass is an inorganic substance as would naturally be inferred from its being the result of fusion, but some organic substances are called vitreous. Some rocks have a vitreous structure, like that of artificial glass, as, for instance, obsidian, which is often called *volcanic glass*. (See *obsidian* and *trass*.) The glass produced in furnace operations are vitreous substances, but usually only translucent, and not transparent because the vitrification is incomplete, and also because they are too deeply colored by metallic oxides. Glass as the word is generally understood is an artificial product and one of the most important of man-made articles. Its valuable qualities are: the ease with which it can be made to take any desired shape; the great resistance to the small cost of the materials of which it is made; durability, and especially resistance to decomposition by acids and corrosive substances; generally, transparency, a quality of the utmost importance as evidenced by its use for windows and in optical and chemical instruments; and the beautiful luster of those kinds which are used for ornamental purposes. Almost the only drawback to these good qualities of glass is its brittleness. The bases used in glass-manufacture are chiefly silica, potash, lime, alumina, and oxide of lead, and the quality of the article produced depends on the nature and amount of the basic material united with the silica. The combinations of silica with a simple alkaline base, either potash or soda, are soluble in water, and are known as *water-glasses*. (See *soluble glass*, below.) They are useful substances, but very different in their properties from what is ordinarily known as glass. In addition to the alkaline base there must be an alkaline earth or a metallic oxide. The cheapest glass is that used for bottles; in this the basic material is chiefly lime, with some potash or soda, and alumina. Glass for medicine bottles differs from ordinary bottle-glass in containing more potash than the latter, and also in the greater purity of the material used. Window-glass usually contains both soda and lime; here absence of any trace of color is important, except in the most inferior qualities. Potash and soda render the glass more fusible; alumina diminishes its fusibility; lime makes it harder; lead gives luster, stability, and high refractive power. Hence, in glass which is to be cut and polished, where beauty is of prime importance, the base is chiefly oxide of lead, which amounts in some cases to half the weight of the material used. Glass in which lead is the essential base is called *crystal* or *flint-glass*. (See these words.) The finer kinds of glass without lead are called *crown-glass*. The tools employed by the glass-blower are simple, but require dexterity for their use. The process of manufacture depends on the fact that, at a very high temperature, glass is a liquid which can be readily cast; at a full red heat it is soft, ductile, and easily worked; when cold, it is hard and brittle. Glass to be serviceable must be annealed after the desired form has been given to it. This is done by heating it nearly to the melting point, and then allowing it to cool very slowly in an annealing-chamber. By the action of hydrofluoric acid, which combines readily with the silica in glass, etching can be done on a glass surface. When cold glass can be ground or cut upon a wheel, scratched by a diamond point (by which means sheets of glass are readily divided or shaped, as they will break easily along the lines of such scratches), cut and polished, or "ground" by a sand blast, and brought to an exceedingly high polish. Specimens of Egyptian glass are in existence which can be dated back to about 2400 B. C.; in Egyptian sculptures of 4000 B. C., glass bottles are undoubtedly represented; and among the bas-reliefs of Beni Hassan, about 2000 B. C., various operations of glass blowing are portrayed. In historical Egyptian, Phœnician, and Roman antiquity, glass was in familiar use.

Alabaster glass. See *alabaster*.—**Anaclastic glass** or **vial**. See *anaclastic*.—**Argentine, black, blue, bronze, and green glass.** See the adjectives.—**Biar glass**, ornamental glassware made in the province of Alicante, Spain, especially that made in the sixteenth and seventeenth centuries.—**Bohemian glass.** (a) Ornamental glassware made in Bohemia, famous since the sixteenth century for the richness of the colors employed in its enameled decoration, and especially for its incised or engraved ornament in delicate patterns. (b) Glass having a lime base instead of a lead base, in this sense including nearly all the ornamental glassware, vessels, etc., of the best periods and styles. Venetian, Spanish, and others. (c) A kind of glass which is quite colorless, hard, difficultly fusible, and less readily acted upon by chemicals than any other kind of glass. Mirrors are often made of it, and it is largely used for the manufacture of chemical apparatus. It is made from ground quartz, purified potash, and lime.

Incised Bohemian Glass. (Museum of Fine Arts, Boston.)

Cameo-glass, in Roman antiq., a kind of artistic glassware formed from glass consisting of superimposed layers of different colors, the outermost of which was cut away so as to leave a design that appears in relief upon the layer underneath as a ground. Glassware of this kind, as originally produced by hand, is extremely costly from the difficulty of the cutting, but it is now imitated with comparative ease by machinery in the ware known as *cased glass*. The universally admired specimens of Greek Roman cameo-glass include the famous Portland vase of the British Museum, the Amphora vase in the same collection, and a beautiful amphora in the Museo Nazionale at Naples. In all these the design is in opaque white on a ground of dark, transparent blue, itself lined with opaque white. The same method was applied by the ancients to tablets or slabs, the interior lining of opaque white being sometimes omitted, and the ground being sometimes in opaque blue, purple, or brown. In rare examples several colors are introduced. **Canary glass**, a bright-yellow glass colored by uranium oxide, having strikingly translucent properties. **Cased glass.** See *cased*, c.

Cast glass. Same as *plate-glass*.—**Claude glass.** See *Claude Lorraine*, under *interior*.—**Colored glass.** Glass which is colored in the pot, whereas enameled glass is made by firing vitrifiable colors on a transparent or other ground. Compare *flushed glass*.

Compressed glass, glass which is tempered by being cast or pressed in chilled molds, a process perfected by Siemens of Dresden. It has a fibrous fracture, may be bored and polished by the wheel, and is believed to be stronger than glass tempered in oil, as in the Bastie process. **E. H. Knight.** **Covered or coated glass.** Glass prepared for stained glass work, etc., by being coated with color on one side, flashed glass. Nearly all the ordinary glass used in windows, etc., is of this character.

Cryolite glass. See *cryolite*.—**Cut glass**, flint glass shaped or ornamented by cutting or grinding with polishing wheels. The surface is commonly cut into grooves, so arranged as to have prismatic and crystal like projections between them. The work is done by rapidly revolving

wheels of stone, iron, or wood, to the periphery of which sand, emery, and polishing powder are applied.—**Devitrified glass**, glass which has been exposed to a great heat and in this way rendered opaque and hard, somewhat resembling porcelain. The process involves a partial crystallization of the previously amorphous mass.—**Diamond-cut glass**, thick glass which has been cut into V-shaped grooves or channels crossing one another at an angle, and leaving pyramid-shaped projections: a common form of ornament on cut glass.—**Diamond-molded glass**, molded or cast glass made to imitate the diamond-cut glass.—**Doubled glass**, a glass made of two or more colors superposed; flashed glass.—**Enameled glass**, glass which has been decorated with vitrifiable pigments, or painted according to the enamel method. See *glass-painting*.—**Erecting glass.** Same as *erector*, I (c).—**Filigree glass.** See *filigree-glass*.—**Flushed glass.** See *flush*.—**Franklin glasses**, spectacles the lenses of which are divided horizontally, each having different powers above and below.—**Glass-melting pot**, the vessel for melting the frit in glass-factories, made of refractory clay mixed with the ground substance of old pots.—**Glass of antimony**, a vitreous oxide of antimony mixed with sulphur.—**Glass of borax**, a vitreous transparent substance obtained by exposing to heat the crystals of borate of sodium.—**Glass of cobalt.** See *cobalt*.—**Granulated glass**, glass the surface of which is raised in slight projections like grains of sand, used for ornamental vessels.—**Ground glass**, any glass that has been depolished by a sand-blast, by grinding, or by etching with acids, so as to break up light transmitted through it, and destroy its transparency.—**Half-minute glass**, a sand-glass used on shipboard to mark the time in heaving the log. See *log*.—**Hardened glass**, tempered or toughened glass.—**Heavy glass**, a technical name formerly given to English flint-glass.—**Kelp glass**, glass of which the alkaline ingredient soda is furnished by kelp. This process is now almost wholly abandoned.—**Kinked glass**, glass the surface of which is raised in small rounded elevations produced by blowing the glass into a mold formed of a more or less fine netting of wire.—**Ladled glass.** Same as *collet*.—**Madrepore glass**, a kind of glass in which star like opaque colored patterns are crowded together in a transparent mass of glass. It is a variety of millefiori glass. See *mosaic glass*.—**Marbleized glass**, a glass which, while hot, has been immersed in water, then reheated and expanded by blowing. The incipient fractures become reunited, but show in the finished object like veins in marble. **E. H. Knight.**—**Matted glass**, glass ornamented by means of certain white or colored mineral powders, applied to the entire surface of the object, and then, in some cases, removed from those parts which are to appear as a dull ground. The glass is then fired, and the composition, which is very fusible, becomes fixed, the result being a bright pattern on a ground resembling ground glass.—**Metalized glass**, an ornamental glass with flakes of gold, mica, platinum, etc., scattered through it.—**Milk-glass.** Same as *crystal glass*.—**Millefiori glass** (It. *mille*, a thousand, + *fiore*, a flower), ornamental glassware made by fusing together tubes or rods of glass enamel (which see, under *enamel*) of different colors, or pieces of filigree. The fused mass is cut into sections, which appear as ornamental figures of varied design, and are embedded in white transparent glass to form paper-weights and objects of like character.—**Mosaic glass**, glass in which a number of pieces of different colors are fused together to form one mass. This is commonly done by means of glass rods, which are laid together sideways, and after being united in one mass can then be cut across, producing a varied pattern at each section; these compound bars can be reheated and pulled out to any degree of tenuity, retaining the pattern at the cross-section on a smaller scale. Such rods are cut into slices for making millefiori glass, etc.—**Muller's glass.** Same as *hyalite*.—**Multiplying glass**, a toy consisting of a convex glass or lens cut with numerous facets, the effect of which is to repeat the image of the object observed as many times as there are facets.—**Murano glass**, glass made at Murano, near Venice. The greater part of the glass called Venetian has always been produced there, and all the modern Venetian glass-works are there.—**Musical glasses.** (a) A musical instrument consisting of graduated strips of glass mounted on a resonance box, so as to be played upon by hammers. (b) A musical instrument consisting either of glass tubes or glass bottles, graduated in size, which can be played by the friction of the moistened finger. Also called *glass harmonica*.—**Ondoyant glass (Fr. *ondoyant*, pp. of *onduler*, wavy, undulate), a modern glass with an uneven wavy surface, made in all tints, used in colored windows to imitate the subtle play and variation of light and color forming one of the characteristic beauties of medieval artistic glass.—**Opalescent glass**, glass having a changeableness of color somewhat like that of the opal, showing cloudy blue, orange red, and intermediate colors, according to the light in which it is viewed.—**Optical glass**, a flint glass used in the manufacture of optical instruments. It contains a large proportion of lead, and hence is of great density.—**Painted glass**, glass ornamented by painting in vitrifiable pigments or enamels: often colloquially used to include colored or stained glass, and compositions in such glass. See *def. 1*.**

Far more important than the introduction of the pointed arch was the invention of *painted glass*, which is really the important formative principle of Gothic architecture; so much so, that there would be more meaning in the name, if it were called the "painted glass style," instead of the pointed arch style.

—**Pot-metal glass**, glass which has been tinted while in a state of fusion, and is therefore colored throughout its substance. — **Pressed glass**, glass brought to shape in a mold by a plunger. — **Reticulated glass**, a variety of flint-glass in which two flint-glass cases or hollow cylinders are used, one within the other, for glass vessels. The threads of opaque or colored glass, being set in opposite directions, produce the appearance of a reticulation. There is usually a small air bubble in each mesh or space between the threads. — **Rice-stone glass**. Same as *alabaster glass*. — **Rolled glass**, an inferior quality of plate glass for which the molten material is dipped from the pot with a ladle and rolled to the proper thickness on an iron table. — **Ruby glass**, glass of deep-red color. A good color is obtained by the use of copper, but the most beautiful is got by the use of gold. Ruby window glass is generally flashed, else its color would be too dark, and it would appear hardly transparent. For the windows of photographic dark-rooms the copper ruby glass is used, as the photographic chemicals are sensitive to the light transmitted by gold glass. — **Silvered glass**. (a) A glass prepared for mirrors, having a metallic layer applied to one side of it. See *looking-glass*. (b) Glass made ornamental by the application of a white metallic film to the unexposed side, giving it a silvery luster. — **Soluble glass**, a silicate of potash or soda made by melting silicious sand with a large proportion of alkali. The silicic acid predominates. It is soluble in hot water, but is not affected by ordinary atmospheric changes, and is thus used to form a protective coating on plastered walls, etc. When used as a cement it is called *mineral lime*. Also called *water-glass*. — **Spun glass**, thin glass wire drawn from glass partly fused. When done on a small scale the glass is heated by the blowpipe, but other means are used where the material is produced in quantity. — **Stained glass**. (a) Properly, colored glass used in windows; particularly, such glass when formed into decorative windows or mosaics of transparent light. Windows representing designs in colored and enamelled glass came into use early in the eleventh century, and attained perfection as compositions in gorgeous and jeweled yet harmonious color at the close of the twelfth and throughout the thirteenth century. After the thirteenth century, while much admirable work was done, the tendency asserted itself to paint pictures on the glass, following more and more closely the manner and ideals of ordinary opaque pictures, until in the course of the sixteenth century the art, having become grotesque, died out, and colored windows gave place to those of plain glass. During the present century this beautiful art has been revived, following the inverse process of its fall, so that the harsh, glaring, and perfunctory attempts of the early years of the modern medieval revival have now given place to work of real merit, in which the pictures are made to fill their true purpose of arrangements of glowing and transparent light, instead of imitating the methods of painting on an opaque surface. (b) Less properly, same as *enamelled glass*. See *glass-painting*. — **Stopping the glass**. See the extract.

During the last two or three hours the fireman or tiscen ceases to add fuel; all the openings are shut, and the glass is allowed to assume the requisite fluidity; an operation called *stopping the glass*, or performing the ceremony.

Ure, Dict., II, 664.

Stove-glass, sheets of mica used in the fronts of stoves, etc. — **Tempered, toughened, or hardened glass**. (a) Glass hardened by being plunged at a high temperature into an oleaginous bath, according to a process invented by M. de la Bastie in 1875 and following years. Such glass cannot be cut by the diamond, and will endure heavy blows and great changes of temperature, but when fractured flies into minute fragments. (b) Glass that has been heated and then suddenly cooled, under the process of F. Siemens. When the articles to be made are such as are generally molded, the molten glass is run into suitable molds and squeezed while it is highly heated, the mold cooling it sufficiently without the liquid bath. — **To crush a glass**. See *to crush a cup*, under *crush*. — **To draw the glass**, to perform the operation of testing the glass, after the fusing and refining are finished, to determine whether it is ready for casting. It is done by plunging the end of a rod into the pot. — **To get a glass in one's head**, to have one's drink go to one's head; become flustered with drink.

It is common for a number of them that have got a glass in their heads to get up into some belly and ring the bells for hours together for the sake of exercise.

glass-blowing (glās'blō-ing), *n.* The process of making glassware and window-glass by taking a mass of viscid glass from the melting-pot on the end of a blowing-tube and inflating it by blowing through the tube. For common window-glass the hot blown mass is extended into a long cylinder by swinging a bulb of hot glass from a bridge on which the workman stands. It is then cut open and flattened out in the flattening furnace. For fine window-glass the bulb of blown glass is cut open and whirled round in the flashing furnace till it flashes, or opens into a flat disk with a bull's eye in the center. A small quantity of glass is also put into molds and then expanded by blowing till it fills the molds. Blown glass is also cut and shaped while hot, and decorated, twisted, and united with other pieces of glass in many different ways. The term *glass blowing* is also applied, though incorrectly, to the making of spun glass and flint-glass by melting and molding rods of soft Bohemian glass in the flame of a blowpipe. Toys and ware made in this way are not properly called *blown glass*, but *flint-glass*.

glass-making (gläs'mā'king), *n.* The making of glass or glassware. The process of making glass consists essentially of the fusing together in a glass-furnace, usually in a fire-clay melting pot or crucible, of the ingredients, after mixing them well and the subsequent treatment of the molten mass or metal in accordance with the quality of the product or the uses which it is to serve. After vitrification is complete and the sum of impurities or glass-gall which rises to the surface has been removed, the temperature of the furnace, which may have reached from 10,000 to 12,000° F., is considerably reduced, so as to bring the fluid and limpid metal into a condition of viscosity, rendering it capable of being worked. The working by which means the glass is made to assume its definitive form, is in general performed by blowing (see *glass-blowing*), casting, or pressing in molds. See *float glass*, *glass-cutting*, *glass-furnace*, *plate glass*.

glass-painting (gläs'pan'ting), *n.* 1. The art or practice of producing designs in color on or in glass.

In glass painting (or glass-drawing, as it is called by the French) two methods are chiefly employed: (a) the *encaustic*, in which the colors are introduced into the glass by means of a pointed tool, and (b) the *mosaic* method, in which a design of separate pieces of glass is pasted on a framework of lead and brass. The latter method is now used for the color be-

ing imparted to the glass in the making. By this latter method were made the splendid medieval windows of the thirteenth century, the beautiful color-effects of which have thus far defied imitation, in spite of modern perfected methods. These admirable color-effects are now recognized to be due not only to perfection of the colors used, and to their judicious juxtaposition and skilful combination with white glass to relieve them and hinder where desirable the blending of contiguous tints, but to unevenness of tone and thickness of the glass primarily due to imperfect processes of manufacture. This last quality is now imitated with artistic success, such glass in general being made by hand, as ordinary machine-made glass is necessarily of even thickness and shade. A combination of the enamel and mosaic methods, known as the *mosaic-enamel method*, in which part of the design is in mosaic and part in enamel, is now commonly used.

glass-pot (gläs'pōt), *n.* A vessel or crucible used for fusing the materials of glass in a glass-furnace. Glass-pots are made of the most refractory earths or fire-clays by a tedious process, to insure the perfect uniformity and dryness necessary to enable them to resist the great heat of the furnace, and they constitute one of the chief elements in the cost of glass. The glass-pots for lead-glass (flint-glass and strass) are covered, and have an opening at the side; for all other kinds of glass they are open, with sloping sides, like pails without handles.

In one method a sheet of tin-foil is laid upon a marble table and painted with mercury till an amalgam is formed. More mercury is added to form a shallow pool, and upon this the sheet of glass is laid and pressed down to drive out bubbles. A thin film of amalgam clings to the glass, and forms the silver-like mirror. In another method a bath consisting in part of silver nitrate is employed, which forms an adherent film of silver on the glass. The second process is used in silvering hollow and convex glassware.

4. An artificial sphere on whose surface is drawn a map or representation of the earth or of the heavens, called in the former case a *terrestrial globe*, and in the latter *celestial globe*. Terrestrial globes are made so as to revolve freely about an axis representing that of the earth. This axis turns in a vertical brass circle divided into degrees, or smaller divisions; and this represents the meridian of any station. This meridian has a motion in its own plane, so that the axis can be brought into parallelism with that of the earth at the assumed station. The meridian moves in a fixed horizontal circle of wood, called the horizon, which is divided into signs, days, etc. Cheaper globes are made without these circles. Celestial globes of the ordinary kind with the drawing, as in terrestrial globes, on the outer or convex surface, represent the stars as they would appear in a mirror, or as if viewed from without the celestial sphere, and not as they appear on a map of the heavens; but globes are also made with the heavenly bodies represented on the inner surface as they appear from the earth.

Globigerinae (glōb'i-je-rī'nē), *n. pl.* [NL., *pl. of globigerina*.] Same as *Globigerinidae*.

It is no longer certain that at all depths down to 2400 fathoms or thereabouts, *Globigerina* in all stages of growth and containing more or less protoplasmic matter are found at the bottom, mixed with the cases of the surface Diatoms and the skeletons of Radiolaria. The proportion of *Globigerinae*, *Orbulina*, and *Pulvinularia* in the deep-sea mud increases with the depth, until, at depths beyond 1000 fathoms, the sea-bottom is composed of a fine chalky ooze made up of little more than the remains of these Foraminifera and their associated Diatoms and Radiolaria.

Huxley, Anat. Invert., p. 80.

globigerina-mud (glōb'i-je-rī'nū-mud), *n*. A chalky mud or ooze occurring in enormous deposits on the bottom of the ocean, largely consisting of the debris of the shells of *Globigerinidae*.

globigerina-ooze (glōb'i-je-rī'nū-ōz), *n*. Same as *globigerina-mud*.

If we suppose the globe to be uniformly covered with an ocean 1000 fathoms deep, the solid land covering its bottom would be out of the reach of rain, waves, and other agents of degradation, and no sedimentary deposits would be formed. But if Foraminifera and diatoms, following the same laws of distribution as at present obtained, were introduced into this ocean, the fine rain of their silicious and calcareous hard parts would commence, and a circumglobal cap of silicious deposit would begin to make its appearance in the north and in the south; while the intermediate zone would be covered with *globigerina ooze*, containing a comparatively small proportion of silicious matter. The thickness of the beds thus formed would be limited only by time and the depth of the ocean.

The beds of chalk which underlie the nummulitic limestone and occupy a still greater area are essentially identical with the *globigerina ooze*, the species of *Globigerina* found in it being indistinguishable from those now living.

Huxley, Anat. Invert., pp. 80-82.

Globigerinidae (glob-i-jer-i-ni-dä), *n. pl.* [NL., < *Globigerina* + -idae.] A family of chiefly pelagic foraminiferous rhizopods, with the perforate test free and calcareous, its several chambers inflated or globose and arranged in a turbinate spiral, the aperture simple or multiple and conspicuous, opening into an umbilical depression, and no supplementary skeleton or canal system. The family occurs from the Trias to the present day, and the remains of its individuals constitute much of the chalky mud found at the bottom of the sea, as well as vast extents of limestone. Like other foraminifers, they were originally mistaken for and described as minute cephalopods, owing to the form of the chambered shells. But they are protozoan animals, whose soft parts consist of apparently structureless protoplasm, like that of other foraminifers and of rhizopods in general, which has the power of secreting lime and building of this substance a shell of characteristic form. The *Globigerinidae* are prominent among many related forms of foraminifers, for the profusion in which they occur, their myriads having furnished the material for considerable of those parts of the earth's crust which consist of limestone. In this respect the globigerines resemble nummulites, but they are still in existence, and in the present formation of globigerinid at the bottom of the ocean is witnessed a process by which solid rock may be formed from the hard chalky shells of microscopic organisms whose soft parts have long since perished. See *Foraminifera*. Also *Globigerina*, *Globigerinida*.

2. The first two clauses are given in Luke ii, 14, as sung by angels; and both this shorter form, as sung in churches in early times and still in use in some Oriental offices, and the enlarged form are therefore known as the *angelic hymn*. In some Eastern liturgies it stands at the beginning of the eucharistic office. In Western rites it is found at the beginning of mass, after the introit and Kyrie, and before the collect, as in the Roman missal, and also in the Use of Sarum and in the Anglican Prayer Book of 1549. In revisions of the Anglican Prayer Book since 1552 it has stood at the end of the Communion Office after communion and a prayer of thanksgiving. In the American Prayer Book it is also an alternate to the Gloria Patri after the last psalm at Morning and Evening Prayer. In the Greek Church it is used after the psalms called lauds (*ōdes*) toward the end of the matin service, and at complin (*anōtēptōn*) after Psalm cxlii. Also called, especially in the Eastern Church, the *great doxology*. **Gloria Patri**, the short hymn, "Glory be to the Father, and to the Son, and to the Holy Ghost. As it was in the beginning, is now, and ever shall be, world without end. Amen." (In the Latin form, "Gloria Patri, et Filio, et Spiritui Sancto, Sicut erat in principio, et nunc, et semper, et in secula seculorum. Amen.") This ascription has been used since very early times in both the Eastern and Western churches. Also called the *lesser doxology*. **Gloria Tibi**, the brief doxology, in Latin, "Gloria tibi, Domine," in the English version, "Glory be to thee, O Lord," said after the announcement of the liturgical gospel in Roman Catholic and Anglican churches. In the Eastern Church the form is, "Glory be to thee, O Lord, glory to thee" (*ᾠδὴ εὐαγγ.*, *δοξα σοι*), and this is repeated after the gospel. In the East the Gloria Tibi is as old as the fifth century or older; in the West it is not mentioned till later.

In military commanders and soldiers, vain *glory* is an
essential point, for as iron sharpens iron, so by *glory* one
courage sharpens another. Bacon, *Vain Glory* (ed. 1887).

A little *glory* in a soldier's mouth
I will be doing. Beaumont and Fl., *King and No King*, I. 1.

See *hand*.—Order of Glory (*Nishan Iftikar*), an order of
the Ottoman empire, instituted by Mahmoud II. in 1831.—
To be in one's *glory*, to be in the full gratification of
one's pride, vanity, taste, notion, or hobby. = Syn. 1. *Fame*,
Renown, *Honor*, *Glory*. *Fame* is simply report, repute,
whereby one is made widely known for what one is, does,
etc.; it may be good or bad, and is thus essentially the
same as *celebrity*; as, an evil *fame* attaches to all traitors.
Renown expresses the same idea through the notion that
one is named again and again by the same persons and
continually by new persons; it may be bad, but is generally
good. *Fame* may be a weak word, but *renown* is always
strong. *Honor* is the least external of these words, in-
dicating often only a respectful frame of mind toward
another; as, to hold one in *honor*. The word, however,
sometimes has the meaning of a wide and excellent *fame*.
It is the only one of the series that means acts or words of
tribute. *Glory* is superlative *fame* or *honor*, but not ne-
cessarily of wide extent. See *famous*.

It is usual for us, when we would take off from the *fame*
and reputation of an action, to ascribe it to vanity, and
a desire of *fame* in the actor.

It is the smallest one of the three which together formed the eighth nerve in the nomenclature of Willis.

Its apparent origin is by several filaments from the upper part of the medulla oblongata in the groove between the restiform and olivary bodies. It leaves the cranial cavity by the jugular or posterior lacerate foramen, together with the pneumogastric and spinal accessory, and passes forward between the jugular vein and the internal carotid artery. It descends along the side of the neck in front of this artery, forming an arch upon the stylopharyngeus muscle and the middle constrictor of the pharynx, and passes beneath the hyoglossus to be distributed in the mucous membrane of the fauces, etc. In the jugular foramen it has two ganglia: the upper, the jugular ganglion; the lower, the petrosus or Andersch's ganglion. It has branches of communication with the pneumogastric, facial, and sympathetic nerves. Its branches of distribution are called the *tympanic* (Jacobson's nerve), *carotid*, *pharyngeal*, *tonsillar*, *lingual*, and *muscular nerves*. See second cut under *brain*.

It is a triatomic alcohol, and dissolves the alkalis, alkaline earths, and some metallic oxides, forming compounds analogous to the alcoholates. It is used in medicine as an emollient and protective dressing, with which, from its consistence and solvent properties, many substances can be incorporated; it absorbs watery discharges, and has some astringent action. The name is also applied to mixtures of glycerin with various substances, whether involving solution or not; as, *glycerin of gallic acid*; *glycerin of starch*. It appears in a great variety of forms, and shows all stages of passage from true granite to a perfectly schistose condition, in which case the feldspar disappears, and the rock becomes a true mica schist. Porphyritic gneiss is characterized by the presence of large distinct crystals or rounded kernel-like masses of feldspar. Gneiss often contains hornblende instead of or associated with mica, and then receives the name of *hornblende* or *gneiss*. The designation of mystery or vailing is applied to it [the occult or mystic system], as having been veiled from all except the initiated. The doctrines thus concealed were denominated *Gnosis* or Knowledge, and Sophia, or wisdom, and were accounted too sacred for profane or vulgar inspection.

J. B. F. Knight's Anc. Art and Myth. (1876), p. 4. His [Origen's] *gnosis* neutralizes all that is empirical and historical, if not always as to its actuality at least absolutely in respect of its value. *Encke, Brit.*, XVII, 842.

II. *n.* [*cap.*] A member of one of certain rationalistic sects which arose in the Christian church in the first century, flourished in the second, and had almost entirely disappeared by the sixth. The Gnostics held that knowledge rather than faith was the road to heaven, and professed to have a peculiar knowledge of religious mysteries. They rejected the literal interpretation of the scriptures, and attempted to combine their teachings with those of the Greek and Oriental philosophies and religions. They held that God was the unknowable and the unapproachable, that from him proceeded, by emanation, subordinate deities termed *aeons*, from whom again proceeded other still inferior spirits. The Gnostics were in general agreed in believing in the principles of dualism and Docetism and in the existence of a demiurge or world creator. Christ they regarded as a superior *eon*, who had descended from the Infinite God in order to subdue the god or gods of this world. Their chief seats were in Syria and Egypt, but their doctrines were taught everywhere, and at an early date they separated into a variety of sects.

After Christianity began to be settled in the world, the greatest corruptors of it were the pretenders to divine inspiration, as the false Apostles, the *Gnosticks*, the Montanists, and many others.

Stillington, Sermons, II, ii.

Setting out from this principle, all the *Gnostics* agree in regarding this world as not proceeding immediately from the Supreme Being.

the antelope division of the family *Bovidae*; a wildebeest. There are two very distinct species, the common gnu, *C. gnus*, and the brindled gnu, *C. gorgon*, sometimes genetically separated under the name *Gorgoida*. The former stands about 4 feet high at the withers, and is about 5 feet long; the shoulders are hunched; the neck is named like an ass's; the tail is long and flowing like a horse's; the head is like a buffalo's, with a broad muzzle, and beset with long bristly hairs; other long hairs hang from the dewlap and between the fore legs; there are horns in both sexes, in the male massive, meeting over the poll, then curving downward and outward and again turned up at the tip like a muskox's; the color is brownish or blackish, with much white in the tail and mane. The brindled gnu is a larger animal, striped on the fore quarters, with black tail and more copious mane; it is known as the *blue wildebeest*, and by the Bechuan name *kokon* or *kokon*. Both species inhabit southerly parts of Africa, in company with zebras and quaggas, and usually go in herds like other antelopes.

go *gō*, *v.*; pret. *went*, pp. *gone*, ppr. *going*. [See also *gā*: < ME. *ga*, *gou*, *gon*, *goon*, earlier *gūn* (pret. *code*, *gedē*, *gode*, *yode*; also *wente* (prop. the pret. of *wenden*; see *wend*), ppr. *ga-anh*, *goude*, pp. *gan*, *gūn*), < AS. *gān* (pret. *code*, ppr. not found, pp. *ge-gān*) = OS. *gān* = OFries. *gān* = D. *gaan* = MHG. LG. *gan* = OHG. *gan*, *gān*, MHG. *gen*, G. *gēn* (= mod. *leel*, *gā* = Sw. *gå* = Dan. *gå*, of LG. origin); not in Goth. (except in the pret. *iddja*) nor in early Scand.; a defective verb, generally regarded as a contraction of the equiv. AS. *gangan* = Goth. *gaggan*, etc., E. *gang*, with which it has been long confused (see *gang*); but such a contraction is otherwise unexampled (the contraction in AS. *fon*, take, *hūn*, hang, from the fuller form represented by the E. *fung*, *hang*, *q. v.*, being different), and is, on phonetic and other grounds, improbable. The form of the appar. root (Teut. *√ gāi*), the form of the pret. (AS. *code*, Goth. *iddja*), and the fact that the prolific and widespread Indo-Eur. *√ i*, *go*, is otherwise scarcely represented in Teut. (unless in OHG. *ien*, G. *ein* = Dan. *ile* = Sw. *ila*, hasten; AS. *il* = OFries. *il* = *leel*, *il*, the sole of the foot), give some probability to the conjecture that the Teut. *√ gāi* stands for **gāi-*, being the generalizing prefix, Goth. *ga-*, AS., etc., *ge-* (see *i-1*), + *√ i*, *go*. The AS. pres. ind. 1 *gā*, 2 *gāst*, 3 *gāth* = Goth. as if 1 **ga-u*, 2 **ga-is*, 3 **ga-ith*, equiv. to the simple forms 1 **im*, 2 **is*, 3 **ith* (disused perhaps because of possible confusion with similar forms of the verb *be*, namely, 1 *im*, 2 *is*, 3 *ist* = E. *I am*, 2 *art*, 3 *is*); = L. *ire* (pres. ind. 1 *eo*, 2 *is*, 3 *it*) = Gr. *ivai* (pres. ind. 1 *ivai*, 2 *i*, etc., 3 *ivai*) = Skt. *√ i* (pres. ind. 1 *mi*, 2 *si*, 3 *ti*, etc.) = Lith. *viti* = Oslg. *iti*, *go*. In this view, the pret., AS. *code*, Goth. *iddja*, etc. (in comp. *ge-code*, ME. *gade*, *gedē*, *gode*, E. obs. *gode*, *gode*, with occas. pres. *gode*, *geand*), appar. from a different root, is formed from the same root *√ i*, without the prefix.} **I**, *intrans.* 1. They pitch two bushes in the ground, . . . which they term *goalies*, where some indifferent person throweth up a ball, the which whosoever can catch and carry through his adversaries *goalie* hath wonne the game.

Cf. *Capra* (*caper¹*) and *Hircus*.] 1. A horned ruminant quadruped of the genus *Capra* (or *Hircus*). The horns are hollow, erect, turned backward, annular, scabrous, and anteriorly ridged. The male is generally bearded under the chin. Goats are nearly of the size of sheep, but stronger, less timid, and more agile. They frequent rocks and mountains, and subsist on scanty coarse food. They are sprightly, capacious, and wanton, and their strong odor (technically called *hircine*) is proverbial. Their milk is sweet, nourishing, and medicated, and their flesh furnishes food. Goats are of several species, and it is not certainly known from which the domestic goat (*C. hircus*) is descended, though opinion favors the Persian paseng, *C. agagrus*. (See *under anagrus*.) It is quite likely that more than this one teral stock has contributed to the domestic breeds. Goats are all indigenous to the eastern hemisphere, though now raised in all parts of the world, and many varieties are valued for their hair or wool, as the Cashmere goat, the Angora goat, the dwarf or Guinean goat, the Egyptian or Nubian, the Maltese, the Nepal, the Syrian, etc. Some of them are hornless. The nearest wild relative of the goat is the ibex. The so-called Rocky Mountain goat belongs to a different group (see below). The name *goat* is often extended to some goat-like antelopes, as the dzereen. The male of the goat is called a *buck*, and the young a *kid*. The sexes are distinguished as *he-goats* and *she-goats*, or colloquially as *billy-goats* and *nanny-goats*.

Chemical symbol, Au; atomic weight, 196.7. A precious metal remarkable on account of its unique and beautiful yellow color, luster, high specific gravity, and freedom from liability to rust or tarnish when exposed to the air. The specific gravity of pure gold is 19.3. Gold stands first among the metals in point of ductility and malleability. Its tenacity is almost equal to that of silver, two thirds that of copper, and twelve times that of lead. It may be beaten into leaves thin enough to transmit a greenish light. It stands next to silver and copper as a conductor of heat and electricity; its melting-point is about 1,900 C. (or 2,900 F.); it is not attacked by any of the ordinary acids, but combines readily with chlorine; and it is dissolved by a mixture of hydrochloric and nitric acids. The crystalline form of gold is isometric, but crystallized gold is a rarity, and it is extremely uncommon to find crystals with smooth faces and sharp edges. Neither have any very large crystals ever been noticed, nor one so much as an inch in diameter. Arborescent masses, showing irregularly developed crystalline planes, are occasionally found, and such forms are sometimes aggregated into large masses; but much the larger part of the native gold found is entirely destitute of any appearance of crystallization, being usually in the form of small scales, which are often so minute as to be almost invisible to the naked eye. Larger rounded masses, called *ang-*

gets, are occasionally met with, and these are sometimes many pounds in weight. A specimen from the Ural preserved in the collection of the mining school at St. Petersburg weighed nearly a hundred pounds. The largest nugget of which there is any record was found in Australia, and was called the "Welcome." It weighed over 184 pounds, contained by assay 92.2 per cent. of gold, and melted a value when melted of \$16,225. Gold is a widely disseminated metal but does not occur anywhere in large quantities, as compared with the ordinary useful metals. There is no proper ore of gold, this metal being never, so far as known, mineralized by sulphur or oxygen. Although gold is disseminated in fine and usually invisible particles through various ores of the other metals, and in many cases in quantity great enough to be separated with profit, most of the gold of the world is obtained either in the form of native gold, from washing the superficial detritus (sand and gravel), or by separating it from quartz, with which mineral it is almost invariably associated when occurring in veins or segregations in the solid rocks. Native gold is, however, in fact, an alloy of gold with silver, and traces of copper and iron are often associated with it. No native gold entirely free from silver has ever been found. The amount of the latter metal present in the gold varies greatly in different regions. The gold of California usually contains from 10 to 12 per cent. of silver; that of Australia rather less than half as much. The native gold of Mount Morgan, Queensland, approaches more nearly to chemical purity than any hitherto discovered, since it contains 99.7 per cent. of gold, and only a minute trace of silver. Pure gold is very rarely used in the arts. All gold coin and gold ornaments in use are alloys of gold with copper, or with copper and silver. The alloy is used, in the case of coin, because pure gold is too soft to bear rough usage; and for the same reason, as well as to diminish the cost, in the case of gold used for personal ornaments. The coin of England is composed of 11 parts of gold and 1 of copper; that of France and the United States of 9 of gold and 1 of copper. The so-called gold used for jewels and watchcases varies from 8 or 9 to 18 carats fine. (See *carat*, 3.) The alloys of gold with copper and silver are given various shades of color by treatment with chemicals, according to fashion or fancy. Gold has been in use for ornamental purposes from the earliest times.

C., an inscription in letters of gold was set up in Athens, and others in other cities of Greece; the numbers were also marked in gold in the ancient calendars. The golden numbers are used in ecclesiastical computations, with the epact, to determine the day on which the Easter full moon occurs, the date by which all the movable feasts in the church year are determined. gonidium (go-nīd'i-um), *n.* *pl.* *gonidia* (-jā). [*NL.*, < *Gr.* γωνία, generation, seed, + dim. term. -idium.] 1. In algol., a reproductive body produced asexually, as a tetraspore or zoospore.

By some authors the term is made to include also the asexual reproductive bodies of fungi and other cryptogams, being in this sense synonymous with *conidium*.

2. In bryol., a cell filled with granules. *Braithwaite*.—3. One of the green or chlorophyll-bearing elements of lichens, usually occurring in the thalli in a distinct layer, but sometimes not definitely arranged. They are usually variously rounded cells, distinct or in chains or filaments, and multiply by fission. They were formerly supposed to be produced by the hyphae of the thallus at their tips; but some recent observers hold that they are formed endogenously in all parts of the lichen and its fruit; others believe that they originate entirely outside and independently of the lichen.

The various forms of gonidia are found to resemble closely various forms of fresh water algae. The Schwendenerian hypothesis asserts that the gonidia are algae, and that the fungoid part of the lichen is a fungus parasitic upon them. Several forms have been named, as follows: (a) *Leptogonidia*, or gonidia proper, those having a pure chlorophyll green color. They are subdivided into (1) *haplogonidia*, resembling *Protophytes*; (2) *platygonidia*, depressed and variously membranously connected gonidia; (3) *cheilopogonidia* or *cheilopogonia*, which contain orange granules; (4) *conferogonidia* resembling *Conferva*. (b) *Gonidimium*, smaller than gonidia proper, and intermediate between them and gonimium. They include hymenial gonidia—(c) *Gonimium*, which are glaucous green or bluish. They include varieties named and characterized as follows: (1) *haplogonimium* large, simple, or in small groups; (2) *acrogonimium*, which are septonemoid or siphonoid, funiculate, and are characteristic of *Ephebe*; (3) *homogonimium* the commonest form which are smaller, in moniliform chains, are contained in isogonimium, and occur in *Collema*; (4) *epigonimium* like the preceding, but not moniliform, and in globose syngonimium. Also called *chromodium*.

The primordial cell should be referable either to hypha or gonidium. *E. Tuckerman, N. A. Lichens*, Int.

But after this confusion and the non reproductive character of Wallroth's gonidia had long been recognised, the expression was still retained in an altered sense for the Alga of the Lichen-thallus, and with it the terms gonidial layer or gonimic layer (stratum gonimium), hymenial gonidia, and others of the same kind.

planes, particularly the angles formed by the faces of crystals. A *contact* or *hand* - *goniometer* consists of a graduated circle or half-circle, with two arms, movable about a center, and either attached or free. The edges of these arms are brought in close contact with the two surfaces, and the angle is then read off on the graduated arc. A *reflecting goniometer* consists of a graduated circle supported in either a vertical or a horizontal position upon a stand, and provided, first, with a more or less elaborate arrangement for adjusting and centering the crystal to be measured, so that the intersection edge shall be exactly in the axis of rotation of the circle, and, second, with one or (better) two telescopes, in the latter case one serves to project a signal, as a hair cross, upon the surface to be measured and the other to observe this signal as reflected. The angle through which the graduated circle that is, the crystal, must be revolved to make the signal visible, first from one plane and then from the other, is the supplement of the true internal angle between the two faces. A *contact-lever goniometer* is provided with a graduated circle, like the last form, but a point connected with a delicate lever-system takes the place of the telescopes and eye to fix the position first of one and then of the other plane.

Hence *gooschink, gushink, gushink*.] 1. Any bird of the family *Anatida* and subfamily *Anserinae*, of which there are about 40 species of several genera, as well as different varieties of the domesticated bird. See phrases below. Geese are technically distinguished from swans and from ducks by the combination of feathered legs, reticulate toes, stout bill high at the base, and single hind toe. The neck is shorter than in swans, and usually longer than in ducks; the sexes are usually similar, contrary to the rule among ducks. Geese stand higher and walk better than ducks; as a rule they are less decidedly aquatic and more herbivorous, the ceca being more highly developed in consequence. Geese have a peculiar cry or call known as *honking*, and also utter a hissing sound. The flesh of most geese is highly esteemed. The tame goose in all its varieties is supposed to be descended from the graylag or common wild goose of Europe, *A. tenuis*; but some other related species may have contributed to the domestic stock. The pure white variety is entirely artificial, and not related to the snow-geese of the genus *Chen*. The male of the goose is called *gander*, and the young of either sex *gosling*.

(*a*) *Inter legend*, a knot tied by Gordius on the road that connected the pole and the yoke of the ox-cart in which he was riding when he of his son Midas was chosen king of Phrygia. It was so contrived as to defy all attempts to untie it, and the oracle of the temple in which the cart was preserved declared that whoever should succeed in undoing it would become master of Asia. Alexander of Macedon solved the difficulty by cutting the knot with his sword, and the oracle was fulfilled. Hence the phrase is applied to any matter ably difficult, and to the *Gordian knot* of the *Ant.*, is to overcome a difficulty in a bold, trenchant, or violent way.

D. by Hanno, a Carthaginian navigator, as the native name of a wild creature found on those coasts. The account, written orig. in the Punic language and translated into Greek, says that the voyagers found an island, in a lake near a bay called the 'Southern Horn,' full of wild people (*βάρβαροι*, *barbaroi*), the greater part of whom were females (*γυναῖκες*, *gynaikes*), hairy on their bodies, whom our interpreters called *Gorillas* (*Γοργίλλαι*). We pursued them, but could not capture the males (*ἀνδρες*, *andres*); they all escaped, climbing the cliffs and hiding among the rocks; but we captured three females (*θηρία*, *theria*), who, biting and scratching their captors, refused to go along with them. We killed and skinned them and brought the skins to Carthage." (*Periplus*, xviii., in *Geographica Graeca Minora*, ed. C. Müller, l. 13, 14.) These creatures, apparently not regarded by the Carthaginians as human beings, though spoken of in such terms, are supposed to have been apes, probably chimpanzees.] 1. gorilla, of the family *Scotocidae*, suborder *Anthropoidea*, and order *Primates*, most closely resembling man, especially in the form of the pelvis

and in the proportion of the molar teeth to the incisors. It has 13 ribs. The tail is even more rudimentary than in man, having but 3 coccygeal bones instead of 4. The gorilla is also called the *great chimpanzee*, and is a near relative of the chimpanzee. *Protopithecus aethiops* or *Anthropothenus nig. r.* It attains a height of about 5½ feet; is found in the woody equatorial regions of Africa, is possessed of great strength, has a barking voice, rising when the animal is enraged to a terrific roar, lives mostly in trees, and feeds on vegetable substances. Gorillas make a sleeping-place like a hammock, connecting the branches of the sheltered and thickly leaved part of a tree by means of the long, tough, slender stems of parasitic plants and lining it with the broad dried fronds of palms or with long grass. This hammock-like abode is constructed at different heights from 10 to 40 feet from the ground, but there is never more than one such nest in a tree. The animal was unknown to Europeans, except from a vague report, until it was described in 1847 by Dr. T. S. Savage, an American missionary in western Africa. The first skeletons of the gorilla seen in Europe were brought by the American traveler Du Chaillu in 1899. The living specimens since brought to Europe and America have been killed.

Four species are generally recognized, and others have been proposed. The cotton is produced in Africa and Asia, where it is cultivated from very early times, and many varieties have been produced. All the cotton manufac-

ture in civilized countries is the product of several varieties of *G. herbaceum* and *G. barbadense*, but *G. arboreum* is also cultivated in some tropical regions. The fourth species, *G. One of an ancient Teutonic race which appeared in the regions of the lower Danube in the third century A. D. A probable hypothesis identifies them with the Gothones or Guttones who dwell near the Baltic; but there is little reason to believe in their relationship with the Gutes or in their Scandinavian origin. They made many incursions into different parts of the Roman empire in the third and fourth centuries, and gradually accepted the Arian form of Christianity. The two great historical divisions were the Visigoths (West Goths) and the Ostrogoths (East Goths). A body of Visigoths settled in the province of Moesia (the present Servia and Bulgaria), and were hence called Mosogoths; and their apostle Wulfila (Ibas) translated the Scriptures into Gothic. The Visigoths formed a monarchy about 418, which existed in southern France until 507 and in Spain until 711. An Ostrogothic kingdom existed in Italy and neighboring regions from 480 to 555. By extension the name was applied to various other tribes which invaded the Roman empire.

The term *Gothic*, as applied to all the styles invented and used by the Western Barbarians who overthrew the Roman Empire and settled within its limits, is a true and expressive term both ethnographically and architecturally.

3. An epithet commonly applied to the European art of the middle ages, and more particularly to the various Pointed types of architecture generally prevalent from the middle of the twelfth century to the revival of study of classical models in the fifteenth and sixteenth centuries. This epithet was originally applied in scorn (compare def. 2), by Italian Renaissance architects, to every species of art which had existed from the decay of Roman art until the outward forms of that art were revived as patterns for imitation; but, although no longer used in a depreciative sense, the adjective is inappropriate as applied to one of the noblest and completest styles of architecture ever developed, which owes nothing whatsoever to the Goths, and is seldom now described as Gothic in other languages than English. See *medieval* and *Pointed*.

The roof had some non-descript kind of projections called bartizans, and displayed at each frequent angle a small turret, rather resembling a pepper-box than a *Gothic* watch-tower.
Scott, Waverley, viii.

4. In *liturgies*, an epithet sometimes applied to the Mozarabic liturgy, or to the Gallican family of liturgies, in accordance with an incorrect theory that they were first introduced into Gaul and Spain by the Visigoths, or from the fact that they were in use in Gallican and Spanish churches at the time of Gothic domination. An ancient manuscript of the Gallican liturgy still extant is entitled a *Gothic Missal* (*Missale Gothicum*) by a later hand.

II. *n.* 1. The language of the Goths. The Gothic spoke various forms of a Teutonic tongue now usually classed with the Scandinavian as the eastern branch of the Teutonic family, though it has also close affinities with the western branch (Old High German, Anglo-Saxon, etc.). All forms of Gothic have perished without record, except that spoken by some of the western Goths (Visigoths) who at the beginning of the fourth century occupied Dacia (Wallachia, etc.), and who before the end of that century passed over in great numbers into Moesia (now Bulgaria, etc.). Revolting against the Roman empire, they extended their conquests even into Gaul and Spain. Their language, now called *Mozarabic* or simply *Gothic*, is preserved in the fragmentary remains of a nearly complete translation of the Bible made by their bishop, Wulfila (a name also used in the forms *Ulfila*, *Ulfila*, *Ulfilas*) (who lived in the fourth century A. D.), and in some other fragments. These remains are of the highest philological importance, preceding by several centuries the next earliest Teutonic records (Anglo-Saxon and Old High German). The language bears a primitive aspect, indicating its existence under practically undisturbed linguistic conditions for a long period before its appearance in the records. Apart from the Latin and Greek words introduced with Christianity, Gothic shows little trace of foreign influence except in the presence of a few words borrowed from the neighboring Slavs. As the oldest recorded Teutonic tongue, and usually but not always named the original Teutonic type, it stands at the head of the languages of its class, to which it bears a relation like that of the Sanskrit to the other languages of the Indo-European family.

5. A father; a master or superior; an employer; an elderly person. [Slang.]—6. In *mach.*, a self-acting regulator which controls a supply of steam, gas, or water; especially, any device for automatically regulating the amount of power developed in a machine, as in a steam-engine. Governors are made in a variety of forms and with different methods of action. A form of governor for the steam-engine which illustrates well the general function of such devices is shown in the annexed figure. It represents a spindle kept in motion by the engine. A and B are two centrifugal balls. C and C' are the rods which suspend the balls, crossing each other and passing through the spindle at C, where the whole is connected by a round pin at P, through the spindle and the rods and serving as the point of suspension for the centrifugal balls or revolving pendulums. A piece of brass, M, is fitted to slide up and down upon the upper part of the spindle and to this piece the end of the lever N O, whose fulcrum is at P, is attached. This piece of brass is also connected with the ball rods by two short pieces and joints, D E, P Q. When the engine goes

too fast the balls fly further asunder and depress the end Y of the lever, which partly shuts a throttle valve connected with the end O and thus diminishes the quantity of steam admitted into the cylinder, and on the other hand, when the engine goes too slowly the balls fall downward toward the spindle and elevate the end X of the lever, which opens the throttle valve wider, and increases the quantity of steam admitted into the cylinder, thus causing it to be proportioned to the resistance of the engine, and keeping the variation of velocity within narrow limits. A similar contrivance is employed in mills to equalize the motion of the machinery. When any part of the machinery is suddenly started or checked, and the moving power remains the same, an alteration in the velocity of the mill will take place which altera-tion the governor serves to limit. See *gas governor*. Atmospheric, chronometric, etc., governor. See the adjectives. Electric governor, in *mach.* (a) A governor in which the spread of revolving balls or the spread of the rim of a wheel by centrifugal

gal action may act as a check, loser and sound an alarm or control some other part of the mechanism. (b) The regulator used in arc-lamps to control the current. 'royal calich,' but taken for 'real blood,' ML. *saingus rubus*), and the original form is not certain: it was prob. *gradalis*, pointing to a probable corruption (simulating *gradali*, a service-book, a gradual, also an antiphon, etc.; see *gradal*) of ML. *cratella*, dim. of *crater*, a bowl; see *crater*.] In medieval legend, a cup or chalice, called more particularly the *holy grail* or *saingreal*, supposed to have been of emerald, used by Christ at the last supper, and in which Joseph of Arimathea caught the last drops of Christ's blood as he was taken from the cross. By Joseph, according to one account, it was carried to Britain. Other accounts affirm that it was brought by angels from heaven and intrusted to a body of knights, who guarded it on the top of a mountain; when approached by any one not perfectly pure it vanished from sight. The grail having been lost, it became the great object of search or quest to knights errant of all nations, none being qualified to discover it but a knight perfectly chaste in thought and act. The stories and poems concerning Arthur and the Knights of the Round Table are founded on this legend, and it has been still further developed in modern times. See *saingreal*.

An ordinal or other group of wading birds, variously restricted. The term has been transmitted from a former stage of ornithology, and no one has succeeded in defining it with precision. It is often discarded, the waders that had been placed in it being then distributed in three groups, called *Limicolæ*, the precocial shore-birds, *Hydrocolæ*, the altricial waders, as herons, storks, and ibises; and *Alcedicolæ* or *Paludicolæ*, the precocial wading birds, like cranes, rails, and their allies. The first and last do not belong really to grammar, though often for convenience included in the text-books of grammar; *orthoepi* is properly phonology or phonetics, an account of the system of sounds used by a language and of their combinations; and *etymology* is improperly used for an account of the parts of speech and their inflections. The association originated at Washington in 1867, and has spread over the whole country but is most numerous in the northwestern States. There are local and State granges, and a national grange. Women are admitted to membership.

We quite admit in view of the farmers' granges in Illinois and Wisconsin . . . that the design to fix the price at which one's own labor shall be sold is just as common in the great West as in Europe.

S., 113, 155, 165, 179, 180, 181) the principal ones being *Munn vs. Illinois*, and *Chicago, Burlington, and Quincy Railroad Co. vs. Iowa*; so called because they grew out of certain State statutes passed in the interest of the grangers, regulating grain-elevator tolls and the charges of warehousemen and common carriers. The court sustained the constitutionality of these statutes, affirming the common-law doctrine that when private property is devoted to a public use it is subject to public regulation, and holding that this right is not affected by the fourteenth amendment to the United States Constitution, which ordains that no State shall "deprive any person of life, liberty, or property without due process of law."

Pg. *granito*, *< It. granito, granite, lit. grained, < granito, pp. of granire, reduce to grains, seed, run to seed, < grano, grain, seed; see grain.* Cf. *granate, garnet*, and *pomegranate*.] 1. A rock composed of orthoclase-feldspar, mica, and quartz.

and having a thoroughly crystalline-granular texture. While orthoclase is an essential constituent of true granite, trichite feldspars are often present in smaller quantity. The mica is sometimes white or silvery (muscovite), and sometimes dark-brown or even black (biotite). Both varieties are occasionally present together, and some lithologists call only that variety true granite in which both are present. While granite is a thoroughly crystalline rock, distinctly formed crystals of the component minerals are rarely seen in it, except on the walls of cavities. The color of granite is somewhat varied, although in much the larger number of cases the predominating tint is a light gray; some varieties, however, are almost as white as white marble; others are of a light-red or a pink color, which tint is due to the predominance of a rose-colored feldspar. Some varieties of granite are very massive and homogeneous in texture; hence this rock can often be quarried in blocks of large size, granite is much used for building purposes where massiveness and durability are the chief requisites. It resists very poorly, however, the action of fire, flaking off and crumbling under the influence of heat. Many varieties take a fine polish, and are used for interior decoration and for monumental work. Its hardness and coarseness of texture make it unfit for statuary. The theory of the origin of granite, and its relations to the distinctly eruptive lavas on the one hand and the distinctly stratified rocks on the other, have long been subjects of discussion among geologists. Granite has often been called a "Plutonic" rock, to express the idea generally held by geologists that it has become consolidated at considerable depth below the surface, not having been poured out of a volcanic orifice like lava. Among the rocks ordinarily designated as *granite* by quarrymen and others there are many varieties, with a correspondingly varied scientific nomenclature. Of these varieties and names the following are the more important: *pegmatite*, which includes the granites in which the component materials are present in crystalline masses of large dimensions; *porphyritic granite*, a variety with distinct crystals of feldspar scattered through a fine-grained material; *graphic granite*, in which the quartz has assumed forms somewhat resembling Hebrew characters; *spindle, spindite, granitic, hornblende granite, or amphibole granite*, a rock in which hornblende occurs in addition to the other normal constituents of granite, the most famous locality of which variety is Syene, in upper Egypt, from which the name is derived (see *spendite*); *granite*, a granite in which only a dark colored variety of mica occurs; *granulite*, a fine grained granite with red garnets; and *gneiss*, a granitic rock nearly or quite destitute of feldspar, interesting from its frequent association with valuable minerals and metalliferous ores, especially those of tin. See *granulite, granulite, pegmatite, and gneiss* for fuller definitions of these words.

grape grāp, *n.* [*< MH. grape*, sometimes *grape*, *< G. grape*, *< L. grape*, sometimes

in the *pl.* grapes, the bunches of grapes (= *MD. grape* and *krappe*, a bunch of grapes), *< OF. grape*, *grappe*, *grape*, a bunch or cluster, esp. of grapes (cf. *It. dim. grappola*, a bunch of grapes); a particular use of *grape*, *grappe*, also *grape*, *graffe*, a hook, grappling-iron, = *Pr. The fruit of the vine, from which wine is made; a pulpy edible fruit or berry growing in clusters on vines of the genus *Vitis*.

The heathen philosopher, when he had a desire to eat a grape, would open his lips when he put it into his mouth; meaning thereby, that grapes were made to eat, and lips to open. *Shak.*, As you like it, v. 1.

2. The vine which produces this fruit; the grape-vine. The cultivated grape of Europe, whether it be for wine or for table use, is the *Vitis vinifera*, of which there are said to be 1,500 varieties. The more common native species of the United States are the chicken, frost, or winter grape, *V. cordifolia*, the fruit of which is small, very sour, and worthless; the riverside grape, *V. riparia*; the northern fox or plum grape, *V. Labrusca*; the southern fox, bullace, muscadine, or scuppernon grape, *V. vulpina* or *cordifolia*; and the summer grape, *V. aestivalis*. The numerous cultivated table-grapes of the eastern United States are either varieties of these (as the Concord, Catawba, Isabella, Hartford Prolific, etc., derived from *V. Labrusca*, and the Clinton, from *V. riparia*), or hybrids of these with each other or with varieties of *V. cordifolia* (as the Delaware, Niagara, Taylor, etc.). The most successful wine-grapes are for the most part varieties of *V. aestivalis*. All the purely American varieties are remarkable for their power of resisting the attacks of the phylloxera or grape-louse, which has proved so fatal to the European vine, and on this account they have been of late years extensively introduced into the vineyards of Europe. *V. riparia* has been very largely used for this purpose, either taking the place of *V. vinifera* entirely or furnishing stocks upon which that species may be safely grafted. See *under Vitis*.

eats the pulp and parts of the seeds of sometimes three or four berries, and transforms to a pupa in a cocoon made under a flap of leaf cut for this purpose; the moth appears in autumn as the grapes ripen. **Mountain grape**, of Jamaica, the *Coccoloba tenebricola*.—**Sea-grape**, (*Gr.*) The *Ephedra distachta* of southern Russia. (*b.*) The *Sarcocornu brevifolium*, a seaweed with large bladders in grape-like clusters. **Seaside grape**, a name given to several species of *Coccoloba* growing upon the sea-shore, especially to *C. vitacea*. **Sour grapes**, things deemed as worthless only because they are beyond one's reach; in allusion to the tale of the fox which, having tried in vain to reach some grapes which grew on a high vine, went away disgusted, saying, "I don't care; they are sour, anyway."

The American or downy mildew is *Peronospora viticola*, which appears in white, downy patches, chiefly on the under surface of the leaves, producing brown spots on the opposite surface. It also occurs on young stems and fruit. The fructification of the fungus consists of conidia borne upon sparingly branched pinnate conidiophores, and oospores embedded in the leaf. (See *under conidium*.) It has been very destructive in North America, and more recently in southern Europe. The old European grape-mildew is *Oidium Tuckeri*, in which only the conidial fructification is known, the conidia being borne in a single chain on simple conidiophores. The powdery grape-mildew of America is *Erysiphe viticola*, one of the *Erysiphaceae* in which the mycelium is spread over the whole upper surface of the leaf, but does not enter its tissues, and the fructification consists of minute cleistocarpons conceptacles containing asci and spores.

grape-rot (grāp'rot), *n.* Any disease of grapes which results in the decay of the berry. The black-rot fungus is *Phoma viticola*, which causes the grapes to shrivel and turn blackish. It forms numerous pustules just beneath the surface, which are conceptacles containing spores. In America this is the most destructive rot. The white rot is caused by *Coniophthium diplodictia*. When *Peronospora viticola* attacks the berries, the resulting decay has been called brown rot. A recently discovered fungus (*Treeneria fuliginosa*) is said to produce bitter rot.

In *quilted grape-shot* the balls are placed on a circular iron stand round an upright iron spindle, and are secured by a stout canvas covering fastened to the bottom plate and quilted over the balls by manlins, the upper edge of the canvas being tied round the spindle.

Such a method is employed, (1) in order to convey information, as when parallel lines of different length are exhibited which are proportionate to the population, etc., of different countries; and (2) to aid numerical or logical calculations, as when a curve is drawn through points whose coordinates represent the population of a country at successive decadal epochs; and this curve is used to ascertain the population at other dates. Graphical methods are of three kinds: those which make no use of the continuity of space except to show that the extremities of lines are connected, and of this kind are graphs; those which use only the projective properties of space; and those which use the metrical properties of space, and which produce diagrams intended to be measured. Of the last kind, for example, are the graphical methods of statistics, etc. (b) In *pathol.*, a mode of studying diseases of the heart and the great vessels by tracings of an instrument, as the sphygmograph. **Graphical statics.** A method of investigating the strength of structures and other static problems by measurements on drawings made to scale. It is a conductor of electricity, and in the form of a powder is used for coating the non-conducting surfaces of molds in making electrotypes. The most important regions supplying graphite are the Altai mine in Siberia, which furnishes the best material for lead pencils, and Ceylon, whence comes a large part of the coarser material used for stove polish and for lubrication. There are also extensive mines of graphite near Lake Champlain. **Gas-graphite.** Same as *gas-carbon* (which see, under *carbon*).

Coarse sand; a mass of pebbles or of pebbles and sand mixed; stone in a mass of small irregular fragments.—2. Specifically, in *geol.*, the rolled and water-worn material formed from fragments of rock under the combined influence of atmospheric agencies and currents of water. Most gravel consists in large part of pebbles of quartz and crystalline rock, mixed with sand in which quartz greatly predominates, because quartz forms a large part of the most widely distributed rocks of the earth's crust, and is not subject to any chemical change, not decomposing like feldspar and mica, but being only broken up into smaller and smaller fragments; so that there may be in the same bed components of the gravel of every size, from that of the boulder several feet in diameter down to the grain of sand not so large as a pin's head.

The act of gravitating or tending toward a center of attraction.—2. That attraction between bodies, or that acceleration of one toward another, of which the fall of heavy bodies to the earth is an instance. See *gravity*, 1. Gravitation can be neither produced nor destroyed; it acts equally between all pairs of bodies, the acceleration of each body being proportional to the mass of the other; it is neither hindered nor strengthened by any intervening medium; it occupies no time in its transmission; its force is inversely as the square of the distance; and the amount of it is such that a particle distant one centimeter from an attracting gram of matter would by the action of gravitation alone, were no other force present, fall into the center of attraction in 40 minutes and 20 seconds. Inasmuch as the masses of bodies can be measured otherwise than by their weights, namely, by their relative momentums under a given velocity, it follows that the *modulus of gravitation*, or the amount by which the unit mass attracts a particle at the unit distance, which is invaluable, best distinguishes gravitation from every other force. The laws of the attraction of gravitation were demonstrated by Sir Isaac Newton in 1687.

The most considerable phenomenon belonging to terrestrial bodies is the general action of *gravitation*, where by all known bodies in the vicinity of the Earth do tend and press towards its centre.

Bentley, Sermons, vii.

It is by virtue of *gravitation* that matter possesses weight; for the weight of any thing is the expression of the force with which it tends towards the earth.

gravity (grav'i-ti), *n.*; pl. *gravities* (-tiz). [= G. *gravität* = Dan. Sw. *gravitet*, *< F. gravité* = Sp. *gravidad*, *gravedad* = Pg. *gravidade* = It. *gravità*, *< L. gravitas* (-*is*, weight, heaviness, pressure, *< gravis*, heavy; see *grace*3.) 1. Weight, as contradistinguished from mass; precisely, the downward acceleration of terrestrial bodies, due to the gravitation of the earth modified by the centrifugal force due to its rotation on its axis. The amount of this acceleration is

about 32.1 inches (81.5 centimeters) per second at the sea-level and the equator, while at the poles it is 32.1 inches. Gravity is a little less on mountains than at the sea level, in the proportion of a diminution of one thousandth part at every two miles of elevation. There are also other slight variations of gravity, from which the figure of the globe (which see) can be calculated. Generally speaking, gravity is in excess where the radius vector of the globe is in excess of that of the mean spheroid. [The words *gravity* and *acceleration* have been more or less confounded; but the most careful writers use *acceleration* for the attracting force, and *gravity* for the terrestrial phenomenon of weight or downward acceleration which has for its two components the gravitation and the centrifugal force. The centrifugal force at the equator is $\frac{1}{29}$ of gravity. It is everywhere exerted in the plane of the meridian at right angles to the direction of the celestial pole. The direction of gravitation in middle latitudes is inclined about 11.5 to the radius of the earth.]

Line of direction of gravity, the line drawn through the center of gravity of a body in the direction in which gravity tends to move it; the line along which the center of gravity would begin to fall if the body were free.

Specific gravity, the ratio of the weight of a given bulk of any substance to that of a standard substance. The substance taken as the standard is water for solids and liquids, air or hydrogen for gases. The weights of bodies being proportional to their masses, it follows that the specific gravity of a body is equivalent to its relative density, and the term *density* has nearly displaced *specific gravity* in scientific works. As long as the term *specific gravity* was in use, water at 62° F. was taken as the standard in England; when the term *density* is used, water at its maximum density (4° C. or 32.2° F.) is the standard. If great accuracy is required, corrections must be made for temperature and for the buoyancy of the air. Thus, if we take equal bulks of water, silver, and platinum, and weigh them, the silver will be found to be 10.5 times and the platinum 21.4 times heavier than the water; and reckoning the specific gravity of water as unity, the specific gravity of silver is said to be 10.5, and that of platinum 21.4. A common method of obtaining the specific gravity of solids is to weigh the body in air, then in pure distilled water, and divide the weight in air by the loss of weight in water, the result being the specific gravity of the body. There are, however, numerous other ways of obtaining this relation, as by the use of the pycnometer, the hydrometer (which see), etc. See *grav-dissolution*.

The *specific gravity* of a body is the ratio of its density to that of some standard substance, generally water.

Clerk Maxwell, Heat, p. 5.

Specific-gravity beads or bulbs, small hollow spheres, usually of glass, used in determining the specific gravity of a liquid. If a number of them, each having its specific gravity marked on it, be thrown into the liquid, that one which just floats gives the required specific gravity, the others either sinking or floating. **Specific-gravity bottle or flask**, a pycnometer.

gravity-railroad (grav'i-ti-rā-rod), *n.* A railroad in which the cars move down an inclined plane, or a series of inclined planes, under the action of gravity alone. Such roads are often arranged so that the loaded cars in descending pull a train of empty cars up to the summit; or the empty cars may be hauled up by steam power.

gravity-solution (grav'i-ti-sō-lu-shun), *n.* A solution used by lithologists for separating from one another the different minerals of which rocks are composed, by taking advantage of their differences of specific gravity. The method is and goes to the process of acid-dressing, which is a separation of minerals differing in specific gravity in the large way, the fluid used being water. The essential difference, however, is that the fluid used by the lithologist is varied in specific gravity, by dilution, to suit the desired conditions, while the water, of course, remains always the same when used by the one dresser. The idea of using a gravity solution in lithological research originated with Thöni in 1879. The fluid which he used was a solution of the iodide of mercury in iodide of potassium, having a density of 2.77 at 55° F. Several other solutions having a higher specific gravity have since that time been used. See *specific gravity*, under *gravity*.

II. n. 1. A gray color or tint; a color having little or no distinctive hue (chroma) and only moderate luminosity. If only about 5 per cent. of the light is reflected, the surface is called *black*; if as much as 50 per cent. is reflected, it is called *white*. Pure gray has a slightly bluish appearance, owing to contrast with the color of brightness which enters into the sensation produced by white light. A small admixture of red with gray light makes the modified gray called *ashes of roses*. A small amount of green light mixed with gray is not noticed, and if the mixture is placed in juxtaposition with pure gray, the latter looks pinkish by contrast, while the former appears of a neutral tint. A larger admixture of green will give a mouse-gray which properly requires the green to be yellowish-a still larger amount in olive gray, and still more a sage green. The effect of the admixture of violet blue is singularly dependent upon the shade of gray; if it is quite light, the result is a lilac gray or full

lilac, or may be even too purple for lilac, while if the gray is darker a French gray or slate gray results, which needs the addition of red to give lavender gray, although the latter appears bluer than lilac gray. If yellow is mixed with gray, the result is a stone gray or drab gray, or in larger admixture a full drab. All these remarks refer to mixtures of lights, not to mixtures of pigments, the effects of which depend upon the special absorption-spectra of the pigments, and can only be ascertained by direct experiment.

In medieval armor the greaves were often an additional defense, as of cuir-bouilli or of forged steel, worn over the chainse of mail or gambouised work. They inhabit chiefly fresh waters, and are most expert divers and swimmers, but move on land very awkwardly, owing to the back-

ward position of the legs. Because of the apparent absence of a tail, and the singular rills or crests, the aspect of these birds is peculiar. They nest in ponds, lakes, and rivers, generally building among reeds or rushes, and lay several, usually four, elliptical white-colored eggs. One of the best known species is the common dabchick of Europe, *Podiceps podiceps* or *Sylvaticus minor*. The grebe known in America as the dabchick is *Podiceps podiceps*. The largest is the spear-billed or western grebe, *Ichthyophaga occidentalis*, peculiar to western North America. (See cut under *Ichthyophaga*.) The great grebe is a conspicuously crested species of the old world, *Podiceps cristatus*. The European red-necked grebe is *P. arcticus*, a variety of which, *P. lobbeolli*, also inhabits North America. The Slavonian or horned grebe, *P. cornutus*, is common in most parts of the northern hemisphere; the eared grebe, *P. auritus* or *notchedis*, is closely related to it. Some of the grebes reach 2 feet in length, but most of them are much smaller. Greco-Roman (gré kō-rō'man), *a.* Of or pertaining to both Greece and Rome, as the Latin civilization after it had become modified by contact with the higher civilization of Greece, and specifically the art cultivated under Roman domination, almost exclusively by Greek artists.

Greco-Roman art can be traced back as far as the fifth century B. C., but did not acquire extensive development before the Roman spoliation of Greece began in the second century. Greek sculpture at Rome retains the general characteristics of the later Hellenistic work (see *Psephology*); and Roman sculpture became more nearly a national school in its portraits and historical reliefs under the empire. Greco-Roman art is most original in its decoration, which assumes an exuberance and fantastic variety foreign to the pure Greek tradition of moderation and sobriety, while retaining much of the Greek elegance. See *Pompeii*. Also spelled *Græco-Roman*.

(a) A member of the ancient Greek race, one of the chief factors in the history of civilization, inhabiting the territory of Greece, comprising part of the southeastern peninsula of Europe and the adjoining islands, and also extensive regions on the coasts of Asia Minor, Sicily, southern Italy (Magna Græcia), etc. As a result of the conquests of Alexander the Great, many parts of western Asia, Egypt, etc., became partly Hellenized. The true Greeks, or Hellenes, consisted only of the Dorians, Eolians, Ionians, and Achæans; but the name *Greeks*, in its widest sense, includes many peoples of different stock, as the Macedonians, Epirotes, Acarnanians, etc. (b) A member of the modern Greek race, which has descended, with more or less foreign admixture, from the ancient race; especially, a subject of the modern kingdom of Greece.—2. The language spoken by the inhabitants of Greece or by persons of the Greek race. Greek is a branch of the great Indo-European family of languages, being thus ultimately akin to English. Ancient Greek comprised a large number of dialects spoken in Greece proper, and on the coasts of Asia Minor and the adjacent islands, as well as in the numerous colonies of Greeks along the coast of the Mediterranean and Black seas, from Syria and Egypt to Italy, Sicily, and Spain. Of these dialects, four are usually distinguished as having received literary cultivation, namely, Ionic, Doric, Eolic, and Attic. The Old Ionic appears in the Homeric poems (hence also called *Epic*); the New Ionic in the histories of Herodotus. The Doric includes a number of different dialects usually characterized as "rough" or "broad," as contrasted with Attic or Ionic, namely, Doric, Laconian, Corinthian, Megarian, Delphian, Rhodian, Cretan, Cyrenaic, Syracusan, etc.; literary remains being scant (Theocritus, etc.). Eolic includes Lesbian, Boeotian, Thessalian, etc., also with scant literary remains (Pindar, Alceus, Sappho, etc.). Doric and Eolic are made to include many other dialects loosely classified under these names. The Attic, the dialect of Athens, became the standard literary tongue of Greece, and contains nearly the whole of Greek literature. In its later form, as the common dialect, it became the general language of the Greek peoples. As the common speech at Alexandria and in Palestine, it was the language in which the Old Testament became current (the Septuagint), and in which the New Testament was written. It continued, with slight changes, to be the literary language of the Greek world until the fall of the Eastern Empire; and the popular spoken form, with profound internal changes, has continued to the present day, being now the standard language of the new kingdom of Greece, and showing a strong tendency, under the fostering care of patriotic scholars and teachers, to resume the external forms of the ancient Greek. (See *Romance*.) The Greek language is embodied in a literature of extraordinary variety, extent, and permanent interest, comprising works which take the first rank in nearly all the forms of literary art, and have been the accepted models of Roman and modern literature. The language is highly synthetic, having an unlimited facility of derivation and composition; and by reason of this characteristic, and of its richness in idiomatic particles and condensed forms of expression, it lends itself to all the forms of literary art. Its vocabulary is extremely copious, and has been drawn upon freely by the Latin and by modern tongues, being now, with the Latin, the accepted storehouse from which the new terms

needed by modern science are generally derived. Together with Latin, the Greek language has long formed the accepted basis of a scholarly education. Modern interest in its study dates from the fifteenth century, when the Turkish invasions upon the Byzantine empire, and particularly the conquest of Constantinople in 1453, caused the permanent settlement of many Greek scholars in Italy, and hence influenced profoundly the development of the Renaissance. (See *Renaissance*.) Greek is divided chronologically, in the etymologies of this work, into *Greek proper* (Gr.), ancient or classical Greek to about the year A. D. 200; *late Greek* (LGr.), from that time till about A. D. 600; *middle Greek* (MGr.), till about A. D. 1500, and *modern or new Greek* (NGr.), since that date; these periods corresponding to similar periods of Latin. (See *Latin*.) Middle and New Greek are also called *Romantic*. Greek is usually printed in type imitated from the forms of letters used in the later manuscripts. The most ancient manuscripts and the inscriptions exhibit only the capital or uncial forms, without accents and without separation of words. The small letters are comparatively modern. Since it is the only language printed in this dictionary in other than Roman letters, the Greek alphabet, with the Roman equivalents, is here given:

Form.	Equivalent.	Name.	Form.	Equivalent.	Name.
Α α	a	Alpha	Ξ ξ	h	Xi

II. *a.* Of or pertaining to Greece or the Greeks; Grecian; Hellenic. **Greek art**, the art developed in ancient Greek lands, and of which the artists of Athens were the highest exponents. It was early modified by the imitation of foreign models, chiefly Oriental and Egyptian, and reached its highest perfection in the fifth century B. C. Among its salient qualities are originality, vigor, truth, wise moderation, and self-restraint, together with the ever-present love of beauty and hatred of excess, the delicacy of perception and cult of pure intelligence, characteristic of the Greek race, from which, however, a keen appreciation of the practical is never absent. The progress of Greek art can most consecutively be followed in the minor art of vase painting. The most ancient Greek pottery, that of Hissarlik (Troy), presents no obvious Greek character. The related ware of the island of Thera, which can safely be dated as earlier than 1500 B. C., shows in its decoration the awakening of the Greek spirit, which becomes more and more accentuated, and at the same time shows the effects of foreign intercourse, in the oldest vases of other Aegean islands, of Mycena, Corinth, and Attica. Vase painting was finally abandoned about 200 B. C. A few figures, from vases that can be closely dated, are given to indicate the general course and

tendency of Greek art. Other illustrations, referring to all departments of this art, will be found throughout this work. See *Architecture*, *sculpture*, *archae*, *archæology*, *jurisprudence* (*jurisprudence*), *Hellenic*, *marbles* (*marbles*) and *Perseus*.

meny, *Phidias*, *vases* (Greek), etc. (a) *Greek painting*, from the time in antiquity of such artists as Polygnotus, Zeuxis, Apelles, Parrhasius, cannot have been behind its fellow arts; but all the originals have perished, and the materials for study include little more than the pale reflections afforded by Pompeian and other Roman wall paintings, by some frescoed tombs in Italy, Greece, and the Crimea, and by one or two painted sarcophagi of Etruria and Asia Minor.

(b) *Greek sculpture* developed comparatively late, but by the beginning of the fifth century B. C. it had gained a position on a par with that of architecture. The earliest Greek sculpture was in wood (see *sculpture*); all examples of it have perished. Later, this was imitated in stone (of which an Artemis of the seventh century B. C., found at Delos, is a good specimen) and in bronze, the first use of the latter material being ascribed to the artists of Chios and Samos. In the latter half of the sixth century were produced the beautiful painted archaic statues which, until they were unearthed during the last decade, remained buried on the Athenian Acropolis from the time of their entombment during the improvements which followed the Persian wars. (See *archaic*.) The *Apuleian* marbles (see *Apuleian*) of the beginning of the fifth century mark the last period of the archaic. The remainder of the fifth century was the period of *Phidias* (see *Phidias*, 2) and the artists grouped about his name, as Myron and Polykletos. In the following century majesty and the lofty ideal gave place to a more individual and intimate quality (pathos) and to grace, of which Praxiteles was the most prominent exponent, with Scopas and others hardly less famous. The abundant and charming Greek terra-cottas throw a side light on Greek sculpture akin to that supplied by painted vases for the study of Greek painting. (c) *The architecture* of the Greeks was developed from a primitive framed inclosure in wood or rough stones, with a sloped roof to shed the rain. As fully developed it implies the presence of columns, both as supports and for ornament, in a system of hotel construction (see *architecture*), or vertical resistance to superimposed weight. The arch was known to the Greeks, but was practically never employed by them where it could be seen. The most typical production of Greek architecture is the peripteros, or temple of which the cella is entirely inclosed by ranges of columns supporting a low gabled roof. The normal plan of such buildings is rectangular, the length being slightly more than twice the breadth; but the exigencies of special use or of the nature of the site often led to wide deviations from the type, as in the Erechtheum at Athens, and circular buildings of various kinds were not uncommon. The idea of the column was probably imported from Egypt (Doric) and from Assyria (Ionic), as were many motives of decoration, as the frieze and the anthemion, which was derived in direct line, though transformed from the lotus blossom. (For the Greek orders, the Doric, Ionic, and Corinthian, see these words.) Greek architecture found its highest expression in stone, particularly in marble. The structures in wood have, of course, perished, and must be studied from allusions in literature and inscriptions, from certain details of stone buildings, and such remains as the terra-cotta copings of some Athenian tombs, of which the edicules in wood have dis-

appeared, and in vase paintings. Baked bricks are rare or not found in truly Greek work, and, as possibly in prehistoric times. Much use, however, was made of unburned brick, even at a comparatively late date, and considerable remains of such work have been found at Olympia, at Eleusis, and elsewhere. The marble buildings of the period

of perfection, simple and imposing in their general composition, were enriched with statuary and sculptured ornament and brilliantly colored (see *polychrome in architecture*, under *polychrome*) to bring out all their details with full effect in the clear air of the Mediterranean. Until Macedonian preponderance had vitiated the ideals of independent Greece, all this magnificence of art was reserved for the glory of the gods and the public buildings of the state. Luxury in private life was not approved, private houses being small and plain. See *monarchy*, *Greek*.—**Greek Church**, the church of the countries formerly comprised in the Greek, Greek Roman, or Eastern (Roman) Empire, and of countries evangelized from it, as Russia; the church, or group of local and national churches, in communion or doctrinal agreement with the Greek patriarchal see of Constantinople. It is also called the *Eastern Church*, in distinction from the *Western*, the *Latin*, or *Roman Catholic Church*. The full official title of the Greek Church is the *Holy Orthodox Catholic Apostolic Oriental Church*. (See *Catholic*, a, 3 (c).) The epithet *Orthodox* is that most frequently used for the Greek or Eastern church. The estrangement between the Greek and Latin churches, culminating finally in the Great Schism, stands historically in close connection with the division of the Roman Empire into an Eastern and a Western Empire, with the growing power of the see of the new Roman capital, Constantinople or New Rome, the increasing rivalry between the see of Old Rome and that of New Rome, the insertion by the Latin Church of the *plague* (see *plague*) in the Nicene Creed, the question of the ecclesiastical allegiance of the Bulgarians, and of the papal supremacy. Eastern Christianity, including Greece, with the chief see at Thessalonica, which had belonged to the Roman patriarchate, remained with the Eastern Church. Before the ninth century there had been temporary suspensions of communion between the Roman Church and the East. The Great Schism began, however, in the latter part of the ninth century, the principal doctrinal difficulty relating to the *Filioque*. The immediate occasion of suspension of communion was the intrusion by the emperor Michael III., in A. D. 857, of the learned Photius into the see of Constantinople instead of Ignatius, at that time patriarch. The Roman see asserted jurisdiction in the matter as possessing supreme power, and mutual charges of false doctrine and excommunications followed; but Photius was finally acknowledged at Rome as patriarch. The final division was that between Pope Leo IX. and the patriarch Michael Cerularius, in A. D. 1054, since which time Roman Catholics regard the Greeks or Easterns as cut off from the Catholic Church; the Greeks, on the other hand, claim that they have remained faithful to the catholic creed and ancient usages. The Greek Church is the dominant form of Christianity in the Kingdom of Greece, the archipelago with the opposite coast and Cyprus, in European Turkey among both Slavs and Greeks, in part of Austria and Hungary, throughout the Russian empire, and in Rumania, Bulgaria, Servia, and Montenegro. In most of these countries the church authorities are independent of the patriarch at Constantinople. It acknowledges the first seven ecumenical councils. The doctrine of the Greek and that of the Western Church with regard to the Trinity, apart from the question of the *plague* and double procession, and that with regard to the person of Christ, are the same. Baptism is regularly conferred on infants with triple immersion. Confirmation follows immediately upon baptism. Communion is given in both kinds, and to infants as well as adults. The offices of bishop, priest, and deacon are regarded as the three "necessary degrees" of orders. The highest officers of the church are the four patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem, and the Russian Holy governing synod. Honor is paid to relics as in the Roman Catholic Church. The ordinary secular clergy can marry before ordination, but their wives must have been previously single, and they cannot remarry. Only the monastic clergy are advanced to the episcopate and other offices. The liturgical language is not absolutely fixed. In Greek-speaking communities it is Greek; in Slavonic communities, not Russian, but the ancient language known as Ecclesiastical Slavonic or old Bulgarian. **Greek cross**, see *cross*. **Greek embroidery**, fancy work executed by sewing upon a bordered piece of colored cloth, silk, etc., and embroidering the edges of these and the bordered band between them with chain stitch and other ornamental stitches. **Greek fire**, see *fire*. **Greek key**, pattern, a meander.—**Greek lyre**, see *lyre*. **Greek modes**, see *mode*. **Greek partridge**, see *partridge*. **Greek point-lace**, see *lace*. **Greek sculpture**, see *Greek art* (b).—On or at the Greek calends. II. n. 1. The color of ordinary foliage; the color seen in the solar spectrum between wavelengths 0.511 and 0.543 micron. According to the theory generally accepted by physicists, the sensation of

pure green is a simple one. This sensation cannot be excited alone in a normal eye; but the spectrum at wavelength 0.524 micron, if the light be very much reduced, probably excites the sensation with some approach to purity. It is a common error to suppose that green is a mixture of blue and yellow. This notion arises from the observation that a mixture of blue and yellow pigments generally gives a green. The reason of this is that the color of pigments not having a true metallic appearance is that of the light which they transmit; the blue pigment cuts off the yellow rays and the yellow pigment the blue rays, but certain green rays are transmitted by both. But blue and yellow lights thrown together upon the retina excite a sensation nearly that of white, which may incline slightly to green or to pink according to the tinge of the colors mixed. Green under a high illumination appears more yellowish (the sensation being affected by the color of brightness), and darkened appears more bluish; this is especially true of emerald and yellowish greens (above all, of olive greens), and hardly holds for turquoise-green. The terms and phrases below are the common names for hues of green, some of them being also names of pigments.

2. In *law*, to bind one's self that the obligation of another shall be performed, or that something affecting the right of the person in whose favor the guaranty is made shall be done or shall occur. To guarantee the collection of a debt is to bind one's self to pay it if it proves not collectible by ordinary means. To guarantee any subject of a business transaction is to make one's self legally answerable for its being exactly as represented: as, the seller *guaranteed* the quality of the goods; the carrier gave a bill of lading with the words "quantity *guaranteed*" (meaning that he stipulated to be answerable for the quantity specified, without any further question or dispute as to amount).

One may really assume the debt of another, making himself a debtor immediately; but if the engagement is a mere guaranty of the obligation of another it must be in writing. (*Guarantee* is often used for *guaranty*, but in legal matters it is more correct to use *guaranty* for the name of the promise or contract of guaranty, *guarantor* for the maker of the guaranty, and *guarantee* for the person for whom the guaranty is made, and also for the act of performing the guaranty.)

(a) That part of the hilt of a sword which protects the hand. Swords of antiquity and of the middle ages usually had the crossguard. In the sixteenth century, when the use of steel gloves was abandoned and the sword became the chief weapon of persons not armed for war, the guard was made more elaborate by the addition of the pas d'ane. Toward the end of that century the knuckle bow was added, some swords combining these two additions with two straight quillons of which the crossguard is formed. (See cut under *hilt*.) Another guard of this epoch was the shell guard. The basket hilt came into use toward the close of the sixteenth century and lasted through the seventeenth. (See cut under *clay more*.) In the second half of the seventeenth century the guard became more simple, and consisted chiefly of a knuckle bow, the shell of the guard when still used being reduced to a very small saucer-shaped plate surrounding the blade. The knuckle-bow guard continued in use throughout the eighteenth century in sword-worn with civil costume, as well as in most of those used in war, and is still the guard of the modern sword and saber, some cavalry sabers and the hke having this knuckle-guard so expanded laterally as to approach the form of the basket-hilt. [This use is common in English literature from the first appearance of the word; but it is now regarded as colloquial, and from its frequency in the United States, it is generally supposed by Englishmen to be an "Americanism." By an easy extension *guess* is used for *think*, *believe*, or *suppose*, even where the meaning is not at all conjectural, but positive, and it is then logically superfluous, serving merely to make the assertion less abrupt, as, *I guess I will go now* (that is, *I am going now*); *I guess I know what I'm about* (that is, *I know what I am doing*). In most instances this use probably arises from a desire to avoid positive assertion, or from some feeling of hesitation or uncertainty.]=*Syn.* 1. *Imagine, Presume*, etc. See *conjecture*.

The strings are plucked or twanged by the right hand, while they are stopped by the left hand upon small frets placed at regular intervals upon the finger-board. As usually tuned, the compass is between three and four octaves upward from the second E below middle C. The usual tuning of the strings is shown at a, the music being written an octave higher. As the fixed frets prevent distant modulations from the normal key of the instrument, a capo tasto is sometimes attached so as to shorten all the strings at once. The guitar is the modern form of a large class of instruments used in all ages and countries. It is most popular in Spain, but has had periods of great popularity in France and England. Its tone is soft and agreeable, and is especially suited for accompaniments.

A large tract of water extending from the ocean or a sea into the land, following an indentation of the coastline; as, the *Gulf* of Mexico; the *Gulf* of Venice. A gulf is usually understood to be larger than a bay and smaller than a sea, but in many cases this distinction is not observed. Thus, the Arabian sea on one side of the Indian peninsula is of nearly the same size and shape as the Bay of Bengal on the other, while the Bay of Biscay is many times larger than the Gulf of Genoa.

6. In mining, a large deposit of ore in a lode.
—**Gulf Stream**, an oceanic current which first becomes apparent near the north coast of Cuba, whence it advances eastward to the Bahamas, then, turning northward, follows the Atlantic coast with a velocity of from 2 to 5 miles an hour, gradually expanding in breadth and diminishing in depth, but distinctly perceived beyond the eastern edge of Newfoundland as far as about 30 degrees west longitude. Its average breadth from Bermuda to the neighborhood of Nova Scotia is from 300 to 400 miles. Its comparatively high temperature (10 to 20 degrees above that of the surrounding ocean), rapid motion, and deep-blue color make the Gulf Stream a most remarkable phenomenon, and even more interesting than the Kuro Siwo, the corresponding current on the Asiatic coast of the Pacific ocean. The Gulf Stream exerts a most important influence in moderating the climate of France, the British islands, and other parts of western Europe. The distance to which the influence of the Gulf Stream is felt in a northeasterly direction has been the subject of much discussion among theographers. It seems pretty clearly established, however, that a considerable proportion of the effect produced on the climate of northern Europe which was formerly ascribed exclusively to the Gulf Stream is in reality due to a current coming from the Antilles (the Antilles Stream), which joins the Gulf Stream to the north of the Bahamas.

During this process [invagination of the blastopore] the blastopore is carried inward, and the internal opening of the actinostome thus becomes the homologue of the primitive blastopore of the hydroplanula, and also represents the external orifice of the body of the Hydrozoa. gull (gul), *n.* [*< Corn. gullan* = W. *gwyllan* = Bret. *gwyllan*, a gull. Cf. *gullenmol*.] 1. A long-winged, web-footed bird of the subfamily *Larinae*, family *Laridae*, and order *Longipennis*. There are more than 50 species, inhabiting all parts of the world, belonging chiefly to the leading genus *Larus*; other genera are *Chroicocephalus*, *Xema*, and *Rhodostethia*. Many of the species are marine or maritime, but gulls are also found over most of the large bodies of fresh water of the globe. They are strong and buoyant fliers, spending much of the time on the wing, and are voracious feeders upon fish or any animal substances which they can find in the water. They do not dive. The nest is usually placed on the ground or on rocks, and the eggs are two or

three in number and heavily colored. The voice is raucous or shrill, and the birds are very noisy, especially during the breeding season. The characteristic coloration is white with a pearly, bluish, or fuscous mantle, the primaries usually marked with black; the white in some cases has a beautiful rosy hue. In one group of species the head is enveloped in a dark-colored hood; in another the whole plumage is dark, except the white head; in the ivory gull the entire plumage is white. In the kittiwakes, which constitute the genus *Rissa*, the hind toe is rudimentary. Among representative species are the ice-gull or burgomaster, *Larus glaucus*, and the great black-backed gull, *L. marinus*, these two being the largest species; the herring-gull, *L. argentatus*; the mew-gull, *L. canus*; the hooded gulls, *Chroicocephalus atricilla*; the fork-tailed gull, *Xema sabini*; and the wedge-tailed gull, *Rhodostethia rosea*. In the larger gulls the bill is strong and hooked; in the smaller kinds it is slender and straighter, and these grade directly into the terns or sea-swallows. See cuts under *burgomaster* and *Chroicocephalus*.

2. Some sea-bird resembling a gull, as a skua or jaeger, a tern or sea-swallow, a booby or gannet, etc.—**Arctic gull**. It may be a shoulder- or a swivel gun, or resemble the darting gun, which is thrust by hand, but the term is more generally applied to the shoulder-gun, of which there are several patterns, both breech- and muzzle-loading. **Bomb-lance gun.** A bomb-gun. **Centrifugal gun.** See *centrifugal*. **Dahlgren gun.** A smooth-bore gun of cast iron, invented by Lieutenant (afterward Rear-admiral) J. A. Dahlgren (1800-79) of the United States navy.

Dahlgren Gun.

Its principal peculiarities are the unbroken smoothness of its surface, and the relation of its thickness at all points (determined by experiment) to the pressure in firing. Of all large smooth-bore guns, it is, not excepting the 15-inch Rodman gun, the most easily handled. The Dahlgren and Rodman 15-inch guns are equal as to accuracy and efficiency. **Evening gun** (*unlit*, and *unlit*), the warning gun at sunset. In the United States army the time of challenging is regulated by post-commanders, and it is generally later than the time of firing the evening gun. In the United States navy the evening gun is fired from flagships at 3 o'clock P. M. **Fraser gun.** Same as *Wood*. **Gardner gun.** Same as *Gardner*. **Gatling gun.** An American form of mitrailleuse or machine-gun, invented by Dr. R. J.

Musket-caliber ten-barrel Gatling Gun.

Gatling, and first used in the civil war. This gun was the successful proper of the machine-guns. It has from 10 to 16 barrels, with a lock for each barrel, the barrels are arranged in a cluster around a central axis, and both barrels and locks revolve together. The cartridges are fed from a feed case into a hopper on top, and in the later models from a feed magazine. With the 10-barrel gun a fire of about 1,000 shots per minute can be delivered. These guns are made of the following calibers: 0.12, 0.15, 0.18, 0.20, 0.25, 0.30, 0.35, 0.40, 0.45, and 0.50. The gun is mounted upon a tripod or a carriage, according to the service for which they are intended. **Great gun.** (a) A cannon. (b) A person of distinction or importance. — note commonly called a *big gun*. [Colloq.] **Great guns!** a familiar ejaculation of surprise. [Colloq.] **Gun detachment.** See *detachment*.

the shore and a stranded or wrecked vessel. The projectile has at the rear end a shank, to which the line is attached.

Mauser gun. a magazine bolt gun used in the German army. **Morning gun.** a gun fired on a ship of war or at a military post of camp as the first note of the reveille is sounded on the drum, bugle, or trumpet; a reveille gun. **Mountain gun.** See *mountain-artillery*, under *artillery*.

Multicharge gun. a gun constructed to receive two or more separate charges of powder, which are fired consecutively in rapid succession, as, the Lyman-Baskett *multicharge gun*. The charge in the breech chamber is ignited by a friction or other primer; this charge starts the projectile forward, and as its base passes consecutively the openings of the subsidiary chambers or pockets, the charges contained therein are ignited.

Napoleon gun. a bronze 12-pounder used for field artillery, first adopted in France about 1803, under Napoleon III. — **Neck of a gun.** See *neck*.

Paixhans gun. a howitzer for the horizontal firing of heavy shells, introduced by the French general H. J. Paixhans about 1825. **Palliser gun.** a cast-iron gun built with a tube of coiled wrought-iron, invented by Major Palliser of the British army about 1870. The tube is made in two parts, the breech end being shrunk on. This system was designed to utilize the old smooth-bore ordnance by converting it into rifled guns.

Parrott gun. a cast-iron rifled gun strengthened by the breech by slinking coils of wrought iron over it, invented by Captain Parrott of the Cold Spring foundry in New York, and first used in 1861. The calibers are 10, 20, 30, 100, 200, and 300 pounds. The Parrott projectile is of cast-iron, with a brass plate or sabot, cast into a recessed ribbet to prevent turning. The powder gas presses against the bottom and under it so as to expand it into the grooves, and thus assures rotary motion to the projectile. **Quaker gun.** a log of wood mounted on wheels or some other arrangement imitating a cannon, designed to deceive the enemy. So called in humorous allusion to the peace doctrines of the Quakers or Friends.

To conceal the absence of carriages, the embasuries were covered with sheds made of bushes. These were the *Quaker guns* afterwards noticed in Northern papers.

J. E. Johnston, The Century, XXXVI, 320.

Rampart gun. a large piece of artillery fitted for use on a rampart, and not for field purposes. — **Rodman gun.** a cast-iron gun with curved outline, being much thicker over the seat of the charge than elsewhere. The peculiarity of this gun is the method of casting, devised by General Rodman of the United States Ordnance Department, and first employed in 1860. Instead of cooling from the exterior, as in the ordinary method, General Rodman cast all large guns with a hollow core, and cooled them from the interior by a stream of cold water or air, at the same time preventing undue radiation from the exterior by surrounding the flask holding the casting with heating-burners. **Son of a gun.** a rogue; a knave; used humorously.

We tucked him in, and I had hardly done

When, beneath the window calling,

We heard the rough voice of a *son of a gun*

Of a watchman, "One o'clock," bawling.

Burton, H. 20thly Legends, I, 116.

Spencer gun. an American magazine-rifle containing seven cartridges in a metallic tube, which is inserted in the butt stock from the rear. The magazine is operated by a lever in the under side of the gun. **Springfield gun.** a single-loader with a big-caliber, used in the United States army. **To blow great guns** (*quantity*) to blow tempestuously, or with great violence. — said of the wind.

Spunking Jack was so comely, so pleasant, so jolly,
 Though winds *blow great guns*, still he'd whistle and sing.
C. Dobson, Sailor's Consolation.

To break a gun, to house guns, etc. See the verbs. — **Vavasseur gun.** named in the invention of the system, a built-up steel gun with wrought-iron trunnion band, and having three ribs projecting into the bore to replace the grooves usually employed in rifling. **Vetterli gun.** from the inventor, F. Vetterli. (a) A single-loading small arm,

called *guns* (collectively *ordnance*), and familiarly often *great guns*, the others being called *small arms*. In hu-

caliber .405, used in the Italian army. (b) A magazine bolt-gun used in the Italian and Swiss armies. **Whitworth gun**, an English rifled firearm, whether great or small, having a hexagonal bore, with a twist more rapid than usual; invented by Sir Joseph Whitworth. **Winchester gun**, an American magazine-rifle having a horizontal bolt and vertical cartridge-carrier operated by a lever on the under side of the stock. The magazine is below the barrel and in front of the receiver. **Wire gun**, a built-up gun made by winding wire about a tube, or by covering the tube with alternate layers wound circumferentially and laid longitudinally. See *Woodbridge gun*. **Woodbridge gun**, a gun consisting of a thin steel tube wound with square wire, the interstices being filled with melted brazing solder to consolidate it into one mass. **Woolwich gun**, a built-up muzzle-loading cannon used in the British service. The tube is made of solid cast-steel drawn out by heating and hammering. After boring, turning, and chambering, the tube is heated to a uniform temperature and plunged into a covered tank of rape oil to harden and temper it. Wrought-iron coils are shrunk on over the tube to complete the structure. The breech coil is formed of a triple coil, a trunion-ring, and a double coil welded together. The muzzle coil is composed of two single coils united by an end weld. The breech-piece is screwed into the breech-coil so as to abut against the rear end of the tube. The gun is assembled by heating the coils and these when expanded are slipped over the tube and allowed to contract. The tube is kept cool during this operation by forcing a stream of cold water through the bore. These guns have from 7 to 10 grooves semicircular in cross-section, with curved edges and with a uniformly increasing twist. Also called *Fraser gun*. (See also *casemate-gun*, *dynamite-gun*, *machine-gun*, *needle-gun*, etc.)

gun-captain (gun'kap'tan), *n.* The chief of a gun's crew, generally a petty officer.

gun-carriage (gun'kar'āj), *n.* The carriage or structure on which a gun is mounted or moved, and on which it is fired. Naval gun carriages formerly consisted of two sides or brackets of wood, mounted

fixed on a pair of wheels, called a *limber*, to which the horses are attached, so as to form a single four-wheeled carriage. In action it is unlimbered or detached from the fore part, and then rests on its wheels and on a strong support called the *trail*. The *protected barbette gun-carriage*, also called the *Moncrieff gun-carriage* (after its inventor Major Moncrieff), is designed to store up the force of recoil on firing, and apply it to the work of raising the gun to fire over a high parapet. When fired the gun descends under cover by its own recoil, assuming at the same time the loading position, in which it is retained by a toothed wheel and ratchet. When reloaded, by releasing the ratchet, it is brought by a counterweight, which the force of the recoil has elevated, back to its original position. The carriage moves laterally on a circular rail laid on the platform, and can easily be turned in any direction. The same inventor has also designed a hydropneumatic carriage, in which the force is stored up in the form of air, highly compressed in a strong iron cylinder. Also called *artillery-carriage*.

guncotton (gun'kōt'n), *n.* A general name for the nitrates of cellulose, prepared by digesting cotton or other form of cellulose in nitric acid, or preferably in a mixture of nitric and sulphuric acids. A series of nitrates may thus be made, differing in composition and properties according to the strength of acids and time of digestion. Weak acids and short digestion yield trinitro- and tetranitro-cellulose, which dissolve in a mixture of alcohol and ether. This solution is the collodion of commerce. A highly explosive nitrate, to which the name guncotton more properly belongs, is made by digesting clean cotton in a mixture of 1 part nitric acid, specific gravity 1.5, and 3 parts sulphuric acid, specific gravity 1.85, for 24 hours and thoroughly washing the product. This is a hexanitrate of cellulose, C₁₂H₁₄(NO₃)₆O₁₀. It can hardly be distinguished by appearance from raw cotton, and is insoluble in alcohol and ether. When ignited it burns quietly, leaving no residue, but by percussion explodes violently, especially if compressed. Its explosive force is much greater than that of gunpowder. It has been used chiefly for torpedoes and submarine blasting, but is now largely superseded by dynamite.

2. A small cannon or musket suspended horizontally in a swinging frame furnished with a fixed arc, properly graduated, and a movable pointer, for ascertaining the angular distance through which the gun oscillates in its recoil. The initial velocity of the projectile is calculated from the value of the arc of recoil. This method is now nearly obsolete.

then granulated, cleaned or dusted, glazed or polished, and dried. The finished powder is employed for the discharge of projectiles from guns, in blasting, and for other purposes. The proportion of the ingredients in the composition of gunpowder varies in different countries, and with the different uses for which it is designed. The powders used for military purposes are distinguished, according to the fineness and evenness of granulation, as (a) irregular, as *musket*, *mortar*, *cannon*, and *mammot* powders; (b) regular, as *cubical*, *pill*, *he*, *trigonal*, *spherocubical*, and *prismatic* (perforated hexagonal prisms) powders. These powders may have the same composition, but differ in size and form of grain, density, and method of manufacture. *Musket powder* is used for small arms, *mortar powder* for field-guns, *cannon powder* for light siege guns, and the larger-grained and special powders for heavy sea coast guns. Mixtures of a nature similar to gunpowder were known in China and India from remote times, and were especially used for rockets. The invention of gunpowder in Europe has been ascribed to Roger Bacon (about 1214-94) and to a German monk named Schwarz (about 1320), but it was probably introduced into Europe through the medium of the Moors early in the fourteenth century. Its common use in warfare dates from the sixteenth century.

A form in use consists of a box in which the powder is placed between a series of upright plates, the pressure being applied by means of a follower actuated by a horizontal screw. *E. H. Knight.*

They are hydromedusans which pass through a hydroid phase, and in which medusiform bodies are developed. (b) In Günther's system, also, a family of plectognath fishes whose jaws are modified into a beak. (c) In Gill's system, a suborder of *Plectognathi* having no spinous dorsal fin, a body more or less saciform, scales typically spiniform (metachelydially thimble) and with root-like insertions, and toothless jaws enveloped in an enamel like covering. It contains several families, as *Podontidae*, *Trochilidae*, *Tetradontidae*, and *Molidae*. Most of these fishes can blow themselves up into a more or less globular or spherical form by swallowing air, whence they have many popular names, as *balloon-fish*, *blowfish*, *bottle-fish*, *box-fish*, *egg-fish*, *globe-fish*, *swell-fish* or *swell-toad*, etc. (See *globe-fish*.) Some are covered with spines or prickles, whence such names as *horn-fish*, *porcupine-fish*, etc.; and the peculiarity of the teeth gives some of them the names *rabbit-fish* and *parrot-fish*.

gyroscope (ji-rö-sköp), *n.* [= F. *gyroscope*, a name given in 1852 by Foucault to his improved form of Bohmenberger's apparatus, < Gr. *γῆρας*, a circle, + *σκοπεω*, view.] An instrument consisting of a fly-wheel, the axis of which can turn freely in any direction, designed to illustrate the dynamical principles of rotating bodies.

Foucault's Gyroscope.

The instrument commonly called *gyroscope* is better named *gyroscopic top* (which see, under *gyroscopic*). The *gyroscope* proper of Foucault, shown in the figure, consists of a fly-wheel having the small conical bearings of its axis in a well-balanced metallic ring which carries two knife-edges in a line perpendicular to the axis of the fly-wheel, these knife-edges bear upon agates carried in a horizontal plane by an outer vertical ring half suspended from a small copper wire and turning about a vertical axis. The axis of the wheel can thus turn in any direction. By means of an accessory apparatus a velocity of 150 turns a second can be imparted to the fly-wheel. The principal experiments with this apparatus are as follows: *First experiment.*

If, when the fly-wheel is turning rapidly, no considerable force is applied to change the direction of its axis, its direction will remain almost unchanged. For, suppose it were proposed, by an instantaneous impulse, to turn this axis round a fixed axis perpendicular to it; then, at the point where this fixed axis cuts the rim of the fly-wheel, a particle would have to be deflected, and it can be shown by the parallelogram of motions that a velocity must be communicated to it proportional to the velocity it already possessed. Hence, the force required to rotate the axis of a fly-wheel increases with its velocity. Accordingly, when the velocity is very high, the friction on the bearings will change the direction of the axis but very little. But all the surrounding objects partake of the rotation of the earth upon its axis. Consequently, the axis of the fly-wheel will have a relative rotation, and this may be observed with a microscope. *Second experiment.* If the fly-wheel was attached to its axis by a hinge, so that its plane was free to take any inclination to the axis, it is plain that by virtue of centrifugal force it would become perpendicular to the axis, since in this way its particles would be furthest from the axis. If then the outer ring of the gyroscope be held fast in such a position that the axis of the fly-wheel is free to move in the meridian plane, it partakes of the rotation of the earth; and the rotation of the earth and that of the fly-wheel being compounded, the axis of resultant rotation is not quite perpendicular to the fly-wheel. Accordingly, the inner ring will turn on its knife-edges until the axis of the fly-wheel is brought into parallelism with that of the earth, so that the wheel revolves from west to east like the earth. *Third experiment.* On the same principle, if the outer ring be free to turn, but the inner one be fixed horizontally, the outer ring will turn so as to bring the axis of the fly-wheel into the meridian. *Fourth experiment.* Let the inner wheel be thrown out of balance by hanging a weight upon it near one end of the axis; then this weight will each instant communicate a rotation about the knife-edges, compounding itself with the rotation of the fly-wheel about its axis as the rotation of the earth does in the third experiment, and a rotation of the outer ring round its vertical axis will result. Since the resultant axis of the first two rotations is very near that of the fly-wheel, the tendency of the weight to fall will be but slight, and under the influence of the centrifugal force of the third rotation it will move like a conical pendulum.—**Gyroscope governor**, a steam governor in which a gyroscope is employed as a regulator. A change in the speed of the engine causes a heavy gyroscope to change its plane of rotation, this change in turn controlling the speed of the engine. See *governor*.

gyroscopic (ji-rö-sköp'ik), *a.* [*gyroscope* + *-ic*.] Pertaining to the gyroscope; illustrating the dynamical laws of rotation.

The bearings are of great length and large diameter to stand the *gyroscopic* action which occurs in a heavy sea on board ship. *The Engineer, LXVI, 364.*

—**Gyroscopic top**, an instrument consisting of a heavy fly-wheel revolving about an axis one point of which is fixed, but which is otherwise free to move in any way. The fly-wheel being set in rotation, the axis moves about the fixed point in the manner explained under *gyroscope*, fourth experiment.

gyrus (jī-rus, *n.*; *pl.* *gyri* (jī-rī). [L., NL., < Gr. *κύκλος*, a circle, circuit, ring; cf. *gyros*, round; *See gyre.*] In *anat.*, one of the rounded ridges into which the surface of the cerebral hemisphere is divided by the fissures or sulci; a convolution; a *gyre*. The gyri and sulci are complementary and mutually definitive. They are most numerous and best marked in the brain of the higher mammals (which are therefore called *gyrecephalous*), and especially in that of man. Every gyrus in man has its own name; but several different systems of naming are in vogue, and the nomenclature is still shifting. The attempt to identify the hu-

plied to lesser divisions of the surface of the brain, is not always preserved. *Gyrus* is exactly synonymous with *convolution*.—**Angular gyrus**, a certain gyrus of the hemisphere of the brain in man and monkeys. In man it is the short gyrus arching over the upper extremity of the superior temporal fissure, the hindmost one of four parietal gyri, separated by a short vertical sulcus from the supramarginal gyrus. *See fig. 3, and cut under cerebral.*—**Annectent gyrus**, a small or secondary fold, which may connect larger or primary convolutions; especially applied to several such gyri of the occipital lobe, as those forming the connections of the cuneus or occipital lobe. *See cut under cerebral.*—**Arched gyri**, four arched convolutions regularly arranged, in some carnivorous animals, as the dog and wolf, beginning with one which borders the Sylvian fissure and ending with one which forms the margin of the cerebral hemisphere. They are enumerated from *first to fourth*, as by Leuret, or in reverse order (Ferrier), or only three are recognized (Flower), when they are also called *anterior, middle, and posterior* (Mivart).—**Ascending frontal gyrus**, the gyrus bounding the fissure of Rolando in front. Also called the *anterior central gyrus* and *transverse frontal gyrus*. *See cut under cerebral.*—**Ascending parietal gyrus**, the gyrus bounding the fissure of Rolando behind. Also called the *posterior central convolution*.—**Callosal gyrus**, a convolution of the median surface of the cerebrum immediately over the corpus callosum and below the callosomarginal fissure. It is continuous behind with the gyrus hippocampi, and ends in the gyrus uncinatus. Also called *convolution of the corpus callosum*, and *gyrus fornicatus*, from its arched or fornicate figure. *See cuts under cerebral and subv.*—**Cuneate gyrus**, a convolution of the occipital lobe appearing as a wedge-shaped figure on the median aspect of the cerebrum in the fork between the parieto-occipital sulcus and the calcarine sulcus. Also called *occipital lobe* and *cuneus*. *See cut under cerebral.*—**External orbital gyrus**, that part of the orbital surface which lies outside of the triadate sulcus. *Gray*.—**Frontal gyri**, three gyri which compose the superior and lateral surface of the frontal lobe of the cerebrum, all lying in front of the ascending frontal gyrus. They are defined by the superior and inferior frontal sulci, and by the vertical fissure or precentral sulcus.—**Gyrus fornicatus**. Same as *callosal gyrus*.—**Gyrus quadratus**, the quadrate gyrus.—**Hippocampal gyrus**, the continuation of the gyrus fornicatus where it dips down behind and below the corpus callosum, and continues forward to the uncinate gyrus; so called from its relation to the hippocampus.—**Marginal gyrus**. (a) That part of the first frontal convolution which appears on the median side of the hemisphere. *See cut under cerebral.* (b) The gyrus which arches over the extremity of the fissure of Sylvius. *See sulcus*.—**Occipital gyri**, three principal convolutions of the occipital lobe of the cerebrum, separated by two small transverse sulci, and distinguished as *first, second, and third*, from above downward, or, as in fig. 3, *superior, middle, and inferior*. *See cut under cerebral.*—**Orbital gyri**, the gyri or convolutions upon the under or orbital surface of the frontal lobe of the cerebrum, which rest upon the orbital plate of the frontal bone. They are three in number, directly continuous with and corresponding to the frontal gyri. The two best marked orbital gyri are sometimes distinguished as the *internal* and *external*.—**Parietal gyri**, four well marked convolutions upon the superior and lateral surface of the parietal lobe; and especially two of these distinguished as the *ascending parietal* (or posterior central) and the *superior parietal*, the other two being commonly known as the *supramarginal* and the *angular gyrus*. (See other phrases.) In fig. 3, the superior parietal is called *postero-parietal lobe*.—**Quadrate gyrus**, a convolution of somewhat square figure appearing on the median surface of the cerebrum between the callosomarginal sulcus in front and the parieto-occipital sulcus behind, and continuous below with the gyrus fornicatus. Also called *quadrate lobe* and *precuneus*. *See cut under cerebral.*—**Sigmoid gyrus**, the somewhat S-shaped fold which curves about the lateral end of the cruciate fissure, and whose surface includes several constant and well marked "motor areas"; used especially by English writers.—**Temporal gyri**, in fig. 3, a general name of the temporal convolutions; usually in human anatomy more fully called *temporosphenoideal gyri*.—**Uncinate gyrus**, a convolution which appears on the median surface of the cerebrum nearly opposite the beginning of the gyrus fornicatus. It is so called from its shape, and the hook is known as the *crochet* or *uncus*. *See cut under cerebral.*

gyst-ale, *n.* [Appar. < *gystst*, obs. var. of *quest*, + *ale*; but appar. also associated with *guise*, with allusion to festive mummery.] *See the extract.*

In Lancashire, we find the term *Gyst-ale*, which seems to be one of the corruptions of disguising, as applied to mummery, and in this sense the entire name, *Gyst-ale*, is confirmatory of Mr. Douce's observations. *Gyst-ale* or guising, says Mr. Baines, was celebrated in Eccles with much rustic splendor at the termination of the marring season, when the villagers, with a king at their head, walked in procession with garlands, to which silver plate was attached, which was contributed by the principal gentry in the neighbourhood.

gytrash (gī'trash), *n.* [Origin obscure.] A spirit or ghost. [Prov. Eng.]

I remembered certain of Bessie's tales, wherein figured a North-of-England spirit called a "Gytrash"; which, in the form of horse, mule, or large dog, haunted solitary ways, and sometimes came upon belated travellers. . . . Close down by the hazel stems glided a great dog, whose black and white color made him a distinct object against the trees. It was exactly one mask of Bessie's *Gytrash*—a lion-like creature with long hair and a huge head.

many gyri and sulci with those of other mammals encounters difficulties which have thus far been insurmountable except in the cases of the most constant and best marked folds and fissures. (See the cuts.) Additional difficulty is encountered in the fact that different human brains vary in details of the gyri, and the same brain may differ on its opposite sides. The principal gyri are noted in the phrases below. The gyri represent an enormous increase in quantity of the gray cortical matter or cortex of the brain in comparison with the actual superficies of the cerebral hemispheres, some of the folds being separated by fissures an inch or more in depth, and containing three layers of gray matter with three layers of white. The gyri are to some extent an indication of intellectual power, and are better marked when the mental powers of the individual are at their height than in infancy and senility.
